### Keysbrook Motorsport Facility Supplementary Targeted Flora Survey

Dear Jahnn,

Stati Group has proposed to develop the Keysbrook Motorsport Facility on Lot 400, 146 Henderson West Road, Hopeland WA. Following submission of the Environmental Review Document (ERD) to the Environmental Protection Authority (EPA), EPA requested further information in relation to a number of ecological concerns. One of these was a request for a targeted flora survey for the *Environment Protection and Biodiversity Conservation Act 1999* (EPBC Act) listed Threatened orchid *Diuris drummondii* (classified as Vulnerable under the EPBC Act) within two vegetation types in Lot 400 which provide potentially suitable habitat for *Diuris drummondii*.

On 25 January 2023, a Senior Ecologist from JBS&G with more than 15 years of experience in the bioregion, undertook a targeted survey for *Diuris drummondii* within portions of vegetation types VT1 and VT3, which fell within the proposed development envelope (the Survey Area, Figure 1). The targeted survey was undertaken in accordance with EPA's (2016) *Technical Guidance - Flora and Vegetation Surveys for Environmental Impact Assessment*, during the known flowering period for *Diuris drummondii* (November to December or January). The survey was undertaken by traversing the vegetation at 10 m intervals (Figure 1). In addition to *Diuris*, other conservation significant flora taxa known to occur in the vicinity of the Survey Area were also sought, particularly the perennial *Styphelia filifolia* (P3) and *Dillwynia dillwynioides* (P3).

No *Diuris drummondii* or dead orchids belonging to the *Diuris* genus were located during the Survey. No *Dillwynia dillwynioides* or *Styphelia filifolia* were located during the Survey. Six hundred and eighty-six *Jacksonia sericea* (P4) (Attachment 1, Figure 1) were located within the Survey Area and flowering specimens were obtained. *Jacksonia sericea* had been previously identified within Lot 400 but had not been confirmed with a flowering specimen. No other conservation significant flora taxa were identified by the Survey.

A portion of one planned traverse within VT1 was too densely vegetated to access and contained a physical obstruction in the form of a series of wires suspended through the survey area (Plate 1).

The nearest weather station which collected rainfall data for the latter half of 2022 was Cloon (Station 9242), approximately nine kilometres east of the Survey Area. Data from Cloon indicates that the Survey Area may have received 44 mm above average rainfall during the latter half of 2022 (5 % above the annual average), i.e. the growing season immediately preceding the survey (BOM, 2023). This indicates that climatic conditions around the time of the survey area unlikely to have impacted the survey outcomes.
