# Executive Summary

Pluton Resources is currently undertaking an exploration drilling program for iron ore at Irvine Island, situated approximately 135 km north of Derby at the northern end of the Yampi Peninsula in the Kimberley region of north-west Western Australia. Onshore Environmental Consultants (Onshore Environmental) was commissioned to undertake a two season Level 2 flora and vegetation survey of Irvine Island and selected areas of neighbouring islands during 2010 and early 2011. A three day reconnaissance survey was completed during the wet season of 2010 (April) followed by a 14 field day survey in October 2010 (dry season). It has been proposed that a follow-up wet season survey occur in March 2011.

A total number of 172 plant taxa (including varieties and subspecies) from 55 families and 120 genera were recorded during the three day reconnaissance survey of Hardstaff Peninsula between the 8<sup>th</sup> and 10<sup>th</sup> April 2010. The 14 day dry season survey that covered Irvine Island, Flora Island, and parts of Bathurst Island and Kathleen Island between the 13<sup>th</sup> and 26<sup>th</sup> October 2010, recorded 202 plant taxa (including varieties and subspecies) from 58 families and 135 genera. Species representation was greatest among the Fabaceae, Malvaceae, Poaceae, Myrtaceae, Convolvulaceae, Proteaceae, Cyperaceae, Apocynaceae, Phyllanthaceae and Euphorbiaceae families. No plant taxa gazetted as Declared Rare Flora pursuant to subsection (2) of section 23F of the *Wildlife Conservation Act (1950)*, or listed under the *EPBC Act 1999*, were recorded. However, there were three Priority flora species recorded; *Ipomoea* sp. A Kimberley Flora (L.J. Penn 84) (Priority 1), *Phyllanthus aridus* (Priority 3) and *Haemodorum gracile* (Priority 4). Based on current records listed in Florabase eleven plant taxa show range extensions; *Cajanus scarabaeoides* var. *pedunculatus*, *Cullen virens*, *Decaisnina signata* subsp. *cardiophylla*, *Dendrobium affine*, *Fimbristylis leucocolea*, *Fimbristylis schultzii*, *Flemingia parviflora*, *Marsdenia pleiadenia*, *Tephrosia laxa* var. *angustata*, *Tephrosia* sp. E Kimberley Flora (C.A. Gardner 9937) and *Tephrosia subpectinata*. The total flora included two introduced (weed) species; *\*Melinis repens* (Blanketgrass) and *\*Passiflora foetida* var. *hispida* (Wild Passionfruit). Neither taxon is listed as a Declared Weed under the *Agriculture and Related Resources Protection Act, 1976* (ARRP Act).

Seventeen vegetation associations were described and mapped from the Irvine Island Study area; none of the vegetation associations described are listed as Threatened Ecological Communities (TECs) or Priority Ecological Community (PECs). The vegetation associations have been classified into nine Broad Floristic Formations on the basis of canopy structure:

Vegetation Association Code	Broad Floristic Formation	Vegetation Association Description
1a	Low Closed Forest	Low Closed Forest of <i>Sonneratia alba</i>
1b	Low Closed Forest	Low Closed Forest of <i>Rhizophora stylosa</i> and <i>Avicennia marina</i>

Vegetation Association Code	Broad Floristic Formation	Vegetation Association Description
1c	Low Closed Forest	Low Closed Forest of <i>Rhizophora stylosa</i>
1d	Low Closed Forest	Low Closed Forest of <i>Pandanus spiralis</i>
2a	Low Open Forest	Low Open Forest (to Low Closed Forest) of <i>Canarium australianum</i> var. <i>australianum</i> , <i>Sersalisia sericea</i> , <i>Mimusops elengi</i> , <i>Brachychiton diversifolius</i> subsp. <i>diversifolius</i> over Very Open Tussock Grassland of <i>Sorghum plumosum</i>
2b	Low Open Forest	Low Open Forest of <i>Eucalyptus cf. miniata</i> , <i>Eucalyptus tectifica</i> , <i>Corymbia cadophora</i> subsp. <i>cadophora</i> over Low Shrubland of <i>Acacia wickhamii</i> subsp. <i>wickhamii</i> , <i>Scaevola macrostachya</i> , <i>Microstachys chamaelea</i> over Tussock Grassland of <i>Chrysopogon latifolius</i> , <i>Sorghum plumosum</i>
3a	Woodland	Woodland of <i>Eucalyptus miniata</i> over Shrubland of <i>Calytrix exstipulata</i> , <i>Acacia wickhamii</i> subsp. <i>wickhamii</i> , <i>Flueggea virosa</i> subsp. <i>melanthesoides</i> over Closed Hummock Grassland of <i>Triodia bynoei</i>
4a	Open Woodland	Open Woodland of <i>Eucalyptus cf. miniata</i> over Low Woodland of <i>Eucalyptus cf. miniata</i> , <i>Corymbia cadophora</i> subsp. <i>cadophora</i> over Low Closed Heath of <i>Acacia hippuroides</i> , <i>Gonocarpus leptothecus</i> , <i>Microstachys chamaelea</i> with Very Open Tussock Grassland of <i>Sorghum plumosum</i>
4b	Open Woodland	Open Woodland of <i>Eucalyptus cf. miniata</i> over Low Woodland of <i>Eucalyptus cf. miniata</i> , <i>Corymbia cadophora</i> subsp. <i>cadophora</i> over Open Shrubland of <i>Grevillea wickhamii</i> subsp. <i>wickhamii</i> , <i>Buchanania oblongifolia</i> , <i>Grevillea refracta</i> subsp. <i>refracta</i> over Low Open Heath of <i>Distichostemon hispidulus</i> var. <i>aridus</i> , <i>Scaevola macrostachya</i> , <i>Gonocarpus leptothecus</i> over Open Hummock Grassland of <i>Triodia bynoei</i>
5a	Low Woodland	Low Woodland of <i>Corymbia confertiflora</i> , <i>Eucalyptus tectifica</i> over Open Shrubland of <i>Grevillea agrifolia</i> subsp. <i>agrifolia</i> , <i>Flueggea virosa</i> subsp. <i>melanthesoides</i> over Very Open Hummock Grassland of <i>Triodia bynoei</i> in saddles of range, with Low Open Shrubland of <i>Calytrix exstipulata</i> , <i>Calytrix brownii</i> , <i>Buchanania oblongifolia</i> over Very Open Hummock Grassland of <i>Triodia bynoei</i> on peaks
6a	Low Open Woodland	Low Open Woodland of <i>Eucalyptus tectifica</i> , <i>Corymbia confertiflora</i> , <i>Corymbia cadophora</i> subsp. <i>cadophora</i> , <i>Corymbia polycarpa</i> over Shrubland of <i>Grevillea agrifolia</i> subsp. <i>agrifolia</i> , <i>Grevillea refracta</i> subsp. <i>refracta</i> , <i>Buchanania oblongifolia</i> over Low Open Heath of <i>Scaevola macrostachya</i> , <i>Distichostemon hispidulus</i> var. <i>aridus</i> , <i>Acacia wickhamii</i> subsp. <i>wickhamii</i>

Vegetation Association Code	Broad Floristic Formation	Vegetation Association Description
6b	Low Open Woodland	Low Open Woodland of <i>Corymbia confertiflora</i> , <i>Ficus platypoda</i> over High Open Shrubland of <i>Calytrix exstipulata</i> , <i>Verticordia verticillatus</i> , <i>Buchanania obovata</i> , <i>Grevillea refracta</i> subsp. <i>refracta</i> over Open Hummock Grassland of <i>Triodia bynoei</i> , <i>Triodia pungens</i>
6c	Low Open Woodland	Low Open Woodland of <i>Corymbia confertiflora</i> over Open Shrubland of <i>Buchanania oblongifolia</i> , <i>Grevillea wickhamii</i> subsp. <i>wickhamii</i> over Low Open Heath of <i>Scaevola macrostachya</i> , <i>Acacia wickhamii</i> subsp. <i>wickhamii</i> , <i>Distichostemon hispidulus</i> var. <i>aridus</i>
6d	Low Open Woodland	Low Open Woodland of <i>Corymbia cadophora</i> subsp. <i>cadophora</i> , <i>Corymbia confertiflora</i> over Open Shrubland of <i>Grevillea wickhamii</i> subsp. <i>wickhamii</i> , <i>Buchanania oblongifolia</i> over Low Open Shrubland of <i>Triumfetta incana</i> , <i>Calytrix brownii</i> over Very Open Hummock Grassland of <i>Triodia bynoei</i> , <i>Triodia pungens</i>
7a	Low Open Heath	Low Open Heath (to Low Closed Heath) of <i>Scaevola macrostachya</i> , <i>Grevillea wickhamii</i> subsp. <i>wickhamii</i> , <i>Distichostemon hispidulus</i> var. <i>aridus</i>
8a	Scattered Shrubs	Scattered Shrubs of <i>Ficus platypoda</i> over Low Open Shrubland of <i>Cajanus cinereus</i> , <i>Calytrix exstipulata</i> , <i>Corchorus fascicularis</i> over Very Open Hummock Grassland of <i>Triodia bynoei</i> , <i>Triodia pungens</i>
9a	Tussock Grassland	Tussock Grassland of <i>Spinifex longifolius</i>

Vegetation condition for the 100 study sites formally assessed in April and October 2010 ranged from ‘Pristine’ to ‘Very Good’, with only minor disturbances recorded. The disturbances noted included access tracks and localised infrastructure dumps remaining from historical BHP exploration activities, and narrow walk tracks and camp laydown established during the current exploration program by Pluton Resources.

Flora and vegetation values of conservation significance within the Study area were restricted to scattered locations supporting the Priority 1 flora *Ipomoea* sp. A Kimberley Flora (L.J. Penn 84), Priority 3 flora *Phyllanthus aridus* and Priority 4 flora *Haemodorum gracile* (State significance), mangrove features described and mapped as Vegetation Associations 1a, 1b and 1c, and small rainforest patches scattered throughout Vegetation Association 2a (Local significance).

# 1.0 Introduction

## 1.1 Preamble

Pluton Resources holds iron ore exploration leases at Irvine Island situated approximately 135 km north of Derby at the northern end of the Yampi Peninsula in the Kimberley region of north-west Western Australia (Figure 1). Irvine Island is one of up to 1,000 rocky islands within the Buccaneer Archipelago (CALM 1994).

In response to an invitation from Strategen Environmental Consultants (Strategen), Onshore Environmental Consultants (Onshore Environmental) was commissioned to undertake a two-season Level 2 flora and vegetation survey of Irvine Island. A reconnaissance field survey of Hardstaff Peninsula occurred over three days during the wet season of 2010 (April), followed by a larger survey effort during the dry season 2010 (October) that included the entire area of Irvine Island and selected areas of neighboring Bathurst, Kathleen and Flora Islands. It is proposed that a follow-up wet season survey occur during March 2011 to ensure maximum capture of the annual flora component.

## 1.2 Climate

Irvine Island is situated at the western edge of the Fitzgerald Botanical District in the Northern Kimberley bioregion of the Northern Province. The area experiences a hot, tropical, sub-humid climate with long term annual rainfall averaging 761 mm at the nearest Bureau of Meteorology (BOM) weather station at Cape Leveque. Annual rainfall for Irvine Island may be higher than that suggested by the Cape Leveque figures, with records from nearby Koolan Island suggesting a higher annual average of approximately 960 mm. The majority of precipitation occurs between the summer months from December to March (82%), known as the ‘wet season’. Summer rainfall is typically associated with cyclone activity. Maximum summer temperatures average 32°C with relatively high humidities also recorded. Mean minimum summer temperature is in the range of 26°C to 27°C.

Rainfall decreases significantly during winter and spring months, with long term monthly averages for the June to November period ranging from 1 mm to 20 mm. Mean maximum temperatures for the same period range from 28°C to 32°C and mean minimum temperatures range from 19°C to 26°C.

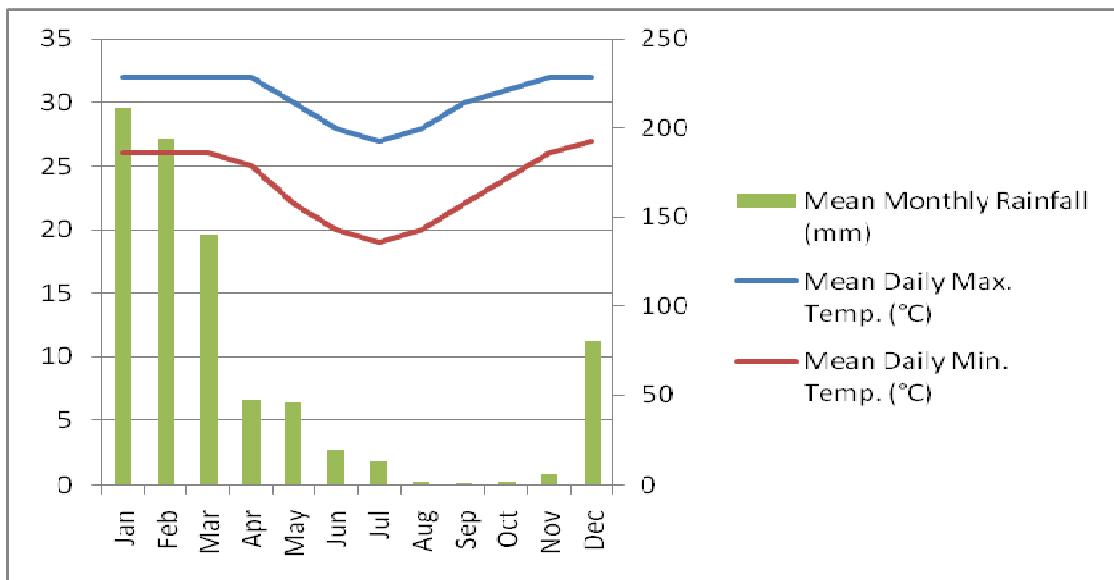

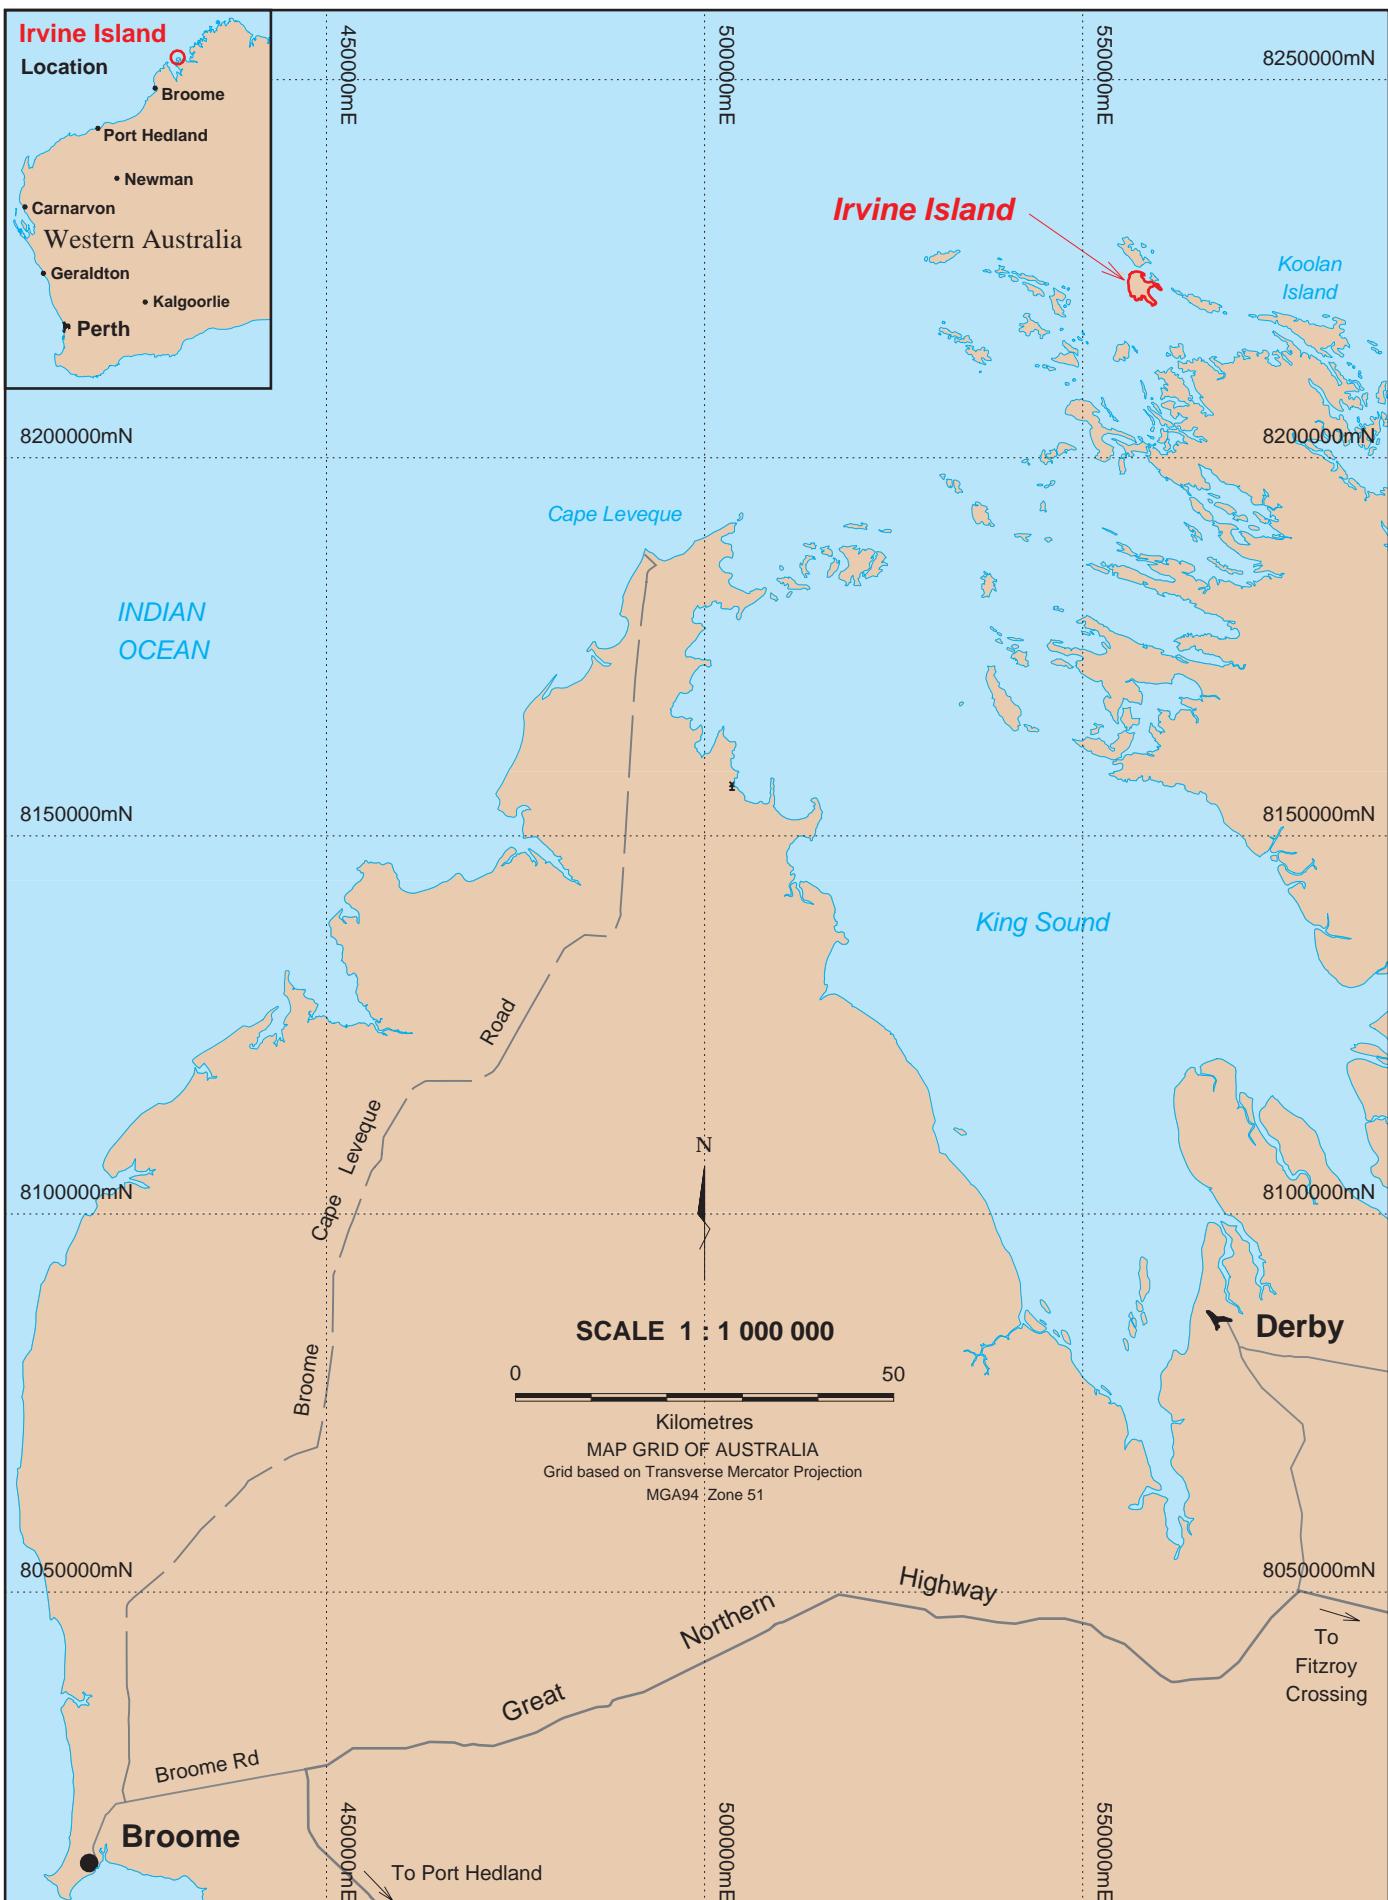

Figure 2 Climatic Data for Cape Leveque (1979-2009) (BOM 2010), the closest BOM weather station to Irvine Island.

## 1.3 Biogeographic Regions

Thackway and Cresswell (1995) describe a system of 85 ‘biogeographic regions’ (bioregions) and 403 sub-regions covering the entire Australian continent. Bioregions are defined on the basis of climate, geology, landforms, vegetation and fauna. The Irvine Island Study area is located in the Mitchell subregion (NK1) of the Northern Kimberley bioregion (Thackway and Cresswell, 1995), within the Northern Botanical Province (Beard 1990).

The Mitchell subregion (NK1) covers 6,079,985 ha and is described as a dissected plateau of horizontal to gently sloping Proterozoic sandstone within the Kimberley Basin. The sub-region is characterised by the following biogeographic features:

- Savannah woodland over high *Sorghum* grasses and hummock grasses on shallow sandy soils on outcropping Proterozoic siliceous sandstone strata;
- Savannah woodlands over high *Sorghum* grasses on red and yellow earths mantling basic Proterozoic volcanics;
- Riparian closed forests of *Melaleuca* and *Pandanus* along drainage lines;
- Rugged sunken coastline with extensive mangal occurring in estuaries and deep sheltered embayments; and
- Numerous small patches of monsoon rainforest (Graham 2001).

### REGIONAL LOCATION

Figure No. 1

A4 Plan No. II-001

## 1.4 Existing Land Use

Land tenure in the Kimberley consists of Aboriginal and leasehold reserves, national parks and reserves and crown land which fall under a range of pastoral and mining leases. The dominant landuses in the Kimberley are pastoralism in the form of cattle grazing on native pastures, unallocated crown land and crown reserves, and conservation (Graham 2001).

## 1.5 Landform & Soils

The Mitchell subregion of the Northern Kimberley has a diverse array of exposed basement strata dissected by rivers, and a rugged sunken coastline with deeply incised embayments. Skeletal sandy soils incompletely mantle the sandstone dominated ranges of the region, and there are significant areas of various volcanic surfaces, as well as lateritised uplands with open forests and alluvial floors along major river valleys (DEC 2009).

Irvine Island (893 ha) occurs on the western fringe of the Mitchell subregion approximately 8 km from the Yampi Peninsula mainland, and adjacent to Cockatoo Island (to the southeast) and Bathurst Island (to the north). Irvine Island has a Proterozoic sandstone lithology that is expressed as a series of parallel flat-topped ridges and uplands mantled with rocky scree and shallow skeletal sandy soils formed from steeply dipping beds of resistant Warton and Pentecost Sandstones. Where the softer Elgee Siltstones have been exposed, a series of deeply incised creeks have been created throughout the island. The coast has typically steep cliffs with narrow gullies and frequent embayments, but with few beaches.

## 1.6 Geology

The Kimberley Basin is a large structural basin occupying most of the Kimberley region with sediments of Lower to Mid Proterozoic age dominant. The Yampi ore bodies lie at the western end of the NW - SE trending King Leopold Mobile Zone which forms the south western border of the Kimberley Basin. Haematite concentration occurs in the basal Yampi member of the Pentecost Sandstone in the Kimberley group. The Kimberley Group comprises essentially a succession of sandstones, quartzites and siltstones, with some interbedded phyllite, unconformably overlying the Speewah Group. The stratigraphy on Irvine Island comprises the Warton Sandstone, Elgee Siltstone and Yampi Member of the Pentecost Sandstone (distinguished by its haematite).

The adjacent Cockatoo and Koolan Islands and mainland have essentially similar geology and geomorphology. The basal part of the Penetecost Sandstone on Irvine Island is composed of high grade haematite (iron ore).

## 1.7 Flora and Vegetation

Beard (1979) placed Irvine Island at the western edge of the Fitzgerald Botanical District in the Central Kimberley Natural Region of the Northern Province (also referred to as the Yampi Peninsula unit). The area is described broadly as 'Tree savanna on sandstone ranges' and mapped as '*Eucalyptus dichromophloia* (bloodwood) and *Eucalyptus miniata* (woollybutt) Low Trees over *Plectrachne pungens* Hummock Grass and *Chrysopogon* Bunch Grass'.

Beard (1979) notes that the Yampi Peninsula is extremely inaccessible and was not surveyed during his study, nor was it previously surveyed by CSIRO scientists as part of the Land Research Survey (Speck *et al.* 1964). Hence, vegetation mapping presented by Beard (1979) is largely presumptive from aerial photo-interpretation. The geological survey memoir (Gellatly and Sofoulis 1973) states "The typical vegetation of low-lying ground is grassy open eucalyptus woodland. Sandstone ridges support only stunted wattle and curly spinifex. Low hills, especially near the coast, have a heavy cover of tall cane grass." Beard (1979) mapped the sandstone ridges as 'curly-spinifex low tree savanna', with the trees being *Eucalyptus dichromophloia* and *Eucalyptus miniata*. On granite it is assumed that the trees change to *Eucalyptus brevifolia*. On basalt and dolerite in the valleys vegetation changes to a high-grass, low tree, savanna woodland with *Eucalyptus tectifica* and *Eucalyptus grandifolia* but somewhat stunted, and a grass layer of *Chrysopogon* spp., *Heteropogon contortus* and annual *Sorghum* (probably the 'Cane grass' grass' noted by Gellatly and Sofoulis 1973). *Eucalyptus perfoliata* is said to be very common on ridges. Numerous patches of mangrove occur in the sheltered bays and inlets.

Beard (1990) described vegetation of the region as 'curly spinifex with low trees of *Eucalyptus phoenicea* and *Eucalyptus ferruginea* or *Eucalyptus brevifolia* and *Eucalyptus dichromophloia* on sandstones; and ribbon grass (*Chrysopogon*) with *Eucalyptus tectifica* on basalt'.

More recent work on the Interim Biogeographic Regionalisation for Australia (IBRA) has placed the survey area within the Northern Kimberley Region of the Northern Botanical Province (Thackway & Cresswell 1995). The Northern Kimberley region is described as 'savanna *Eucalyptus* and *Corymbia* woodlands over grasses and hummock grasses; closed forests along drainage lines, mangroves in estuaries and sheltered bays and patches of monsoon rainforest'.

## 2.0 Objectives

### 2.1 Purpose

The purpose of this report was to undertake a dry season Level 2 flora and vegetation survey of Irvine Island and selected areas of neighbouring islands in October 2010. Reporting would incorporate results from a reconnaissance wet-season flora and vegetation survey of Hardstaff Peninsula completed over three days in April 2010.

### 2.2 Scope of Works

1. Flora and vegetation database review for the survey area and incorporating the following components:
  - Threatened Flora listed under the Commonwealth Environment Protection and Biodiversity Conservation Act (EPBC Act);
  - Declared Rare and Threatened Flora listed under the WA Wildlife Conservation (Rare Flora) Notice 2010;
  - Priority Flora recognised by the DEC - as per current listing;
  - Threatened Ecological Communities (TECs) listed under State and Federal legislation;
  - Priority Ecological Communities (PECs) recognised by DEC; and
  - Environmentally Sensitive Areas (ESAs) recognised by DEC.
2. Provide a summary of previous flora and vegetation surveys at Irvine Island and surrounding islands in the Buccaneer Archipelago.
3. Conduct a targeted survey of Irvine Island for:
  - Threatened Flora listed under the Commonwealth Environment Protection and Biodiversity Conservation Act (EPBC Act 1999);
  - Declared Rare and Threatened Flora listed under the WA Wildlife Conservation (Rare Flora) Notice 2010;
  - Priority Flora recognised by Department of Environment and Conservation (DEC);
  - TECs listed under the Commonwealth EPBC Act 1999;
  - TECs endorsed by the Minister of the Environment;
  - PECs recognised by DEC; and
  - Declared weeds listed under the Agriculture and Related Resources Protection Act, 1976 and other environmental weed species. Co-ordinate locations and photographs of the above are to be provided.
4. Provide descriptions for vegetation associations present in the Study area, according to a recognised classification system (Specht as modified by Aplin);
5. Preparation of a vegetation association map for the Study area;
6. Describe condition of the vegetation associations or areas using a published rating scale;
7. Preparation of a vegetation condition map for the Study area; and
8. Describe the representation in a regional context of each vegetation association.

## 3.0 Methodology

### 3.1 Background

#### 3.1.1 Legislation and Guidance Statements

The flora and vegetation survey was designed to meet requirements of the following State and Commonwealth legislation, and carried out in a manner that was compliant with EPA requirements for the environmental surveying and reporting of flora and vegetation in Western Australia:

- *Environmental Protection Act 1986 (WA)* (“EP Act 1986”);
- *Wildlife Conservation Act 1950 (WA)*;
- *EPBC Act 1999 (Cth)* (“EPBC Act 1999”);
- *Environmental Protection of Native Vegetation in Western Australia: Clearing of Native Vegetation with Particular Reference to Agricultural Areas. Position Statement No. 2* (EPA 2000);
- *Terrestrial Biological Surveys as an Element of Biodiversity Protection. Position Statement No. 3* (EPA 2002); and
- *EPA Guidance for the Assessment of Environmental Factors: Terrestrial Flora and Vegetation Surveys for Environmental Impact Assessment in Western Australia No. 51* (EPA 2004a).

There are two formal levels of flora survey delineated by the EPA:

- *Level One*: A ‘desktop’ study to collate historical knowledge conducted in conjunction with a reconnaissance survey (site inspection); and
- *Level Two*: An intensive survey that incorporates a detailed and comprehensive survey to characterise the flora present, combined with a Level One survey.

Where the scale and nature of the proposed impact is moderate to high, a Level 2 survey will be required in most areas of the State, and is typically required for resource development projects. The expectations of the EPA are set out in *Guidance Statement No. 51* (EPA 2004), which details the extent, design and intensity of field surveys for environmental assessments in Western Australia.

The high level of disturbance to the flora proposed for Irvine Island requires that a Level 2 flora and vegetation survey is completed.

### 3.2 Desktop Searches

The desktop assessment of vegetation and flora values included a literature search, database searches and review of regional mapping. The literature search involved a review of historical reports and past surveys undertaken in the area where available. Database searches were undertaken for information relating to rare flora, Threatened Ecological Communities (TEC) and Priority Ecological Communities (PEC) previously collected or described within, or in close proximity to, Irvine Island. The database searches were extended beyond the immediate survey limits to place flora and vegetation values into a local and regional context. The search co-ordinates

given were for a 100 km radial search of the Irvine Island exploration camp at 16° 05' 26"S 123° 32' 59"E.

The State database search investigated three DEC databases:

1. The DEC Threatened (Declared Rare) Flora Data-base;
2. The DEC Declared Rare and Priority Flora List - this list contains species that are declared rare (Conservation Codes R, X), poorly known (Conservation Codes 1, 2, 3), or require monitoring (Conservation Code 4); and
3. The Western Australian Herbarium Specimen Database for priority species opportunistically collected in the area of interest.

The Federal database search investigated the EPBC database.

## 3.3 Survey Methodology

### 3.3.1 Field Assessment

Prior to the field survey a variety of topographic, vegetation, and land system maps were used to provide preliminary vegetation classification of the Study area. The survey comprised a 14 day effort by two qualified botanists to ground truth the Study area and selected areas on surrounding islands, record identifiable changes in vegetation composition and structure, collect voucher specimens, and assess vegetation classification. The field survey was undertaken from the 13<sup>th</sup> to 26<sup>th</sup> October 2010.

Vegetation type, life-form strata, percentage cover, surface soil type, litter cover and disturbance details were recorded intensively from a total of 84 formal study sites<sup>1</sup> and numerous releve plots<sup>2</sup>. At each study site flora and vegetation occurring within 50 m x 50 m quadrats was assessed in detail. Description of vegetation structure follows the height, life form and density classes of Specht as modified by Aplin (see Appendix 1). This is largely a structural classification suitable for broader scale mapping, but taking all ecologically significant strata into account. Vegetation condition for each of the 84 sampling sites was determined using a recognised rating scale (based on Keighery 1994, see Appendix 2).

At least one voucher specimen was taken for each species collected to verify identification. Specimen identifications were confirmed at the Western Australian State Herbarium. Nomenclature follows Green (1985 & 1987), Paczkowska and Chapman (2000) and the Western Australian State Herbarium.

### 3.3.2 Field Survey Constraints

The EPA Guidance Statement for Terrestrial Flora and Vegetation Surveys for Environmental Impact Assessment in Western Australia (EPA 2004) list twelve

---

<sup>1</sup> An additional 16 formal study sites were previously established at Hardstaff Peninsula during the April 2010 (wet season) reconnaissance survey.

<sup>2</sup> A releve is a vegetation description taken within a delimited plot of vegetation. The description summarises dominant plant species, based on cover values, and stratified into height categories chosen to describe vertical structure.

potential constraints that field surveys may encounter. These constraints are addressed in Table 1.

**Table 1 Relevance of constraints, as identified by EPA (2004), to the Irvine Island flora and vegetation survey.**

Constraint	Relevance
Scope	The scope was established by Strategen and Onshore Environmental in consultation with Pluton Resources, and is in compliance with relevant EPA Guidance Statements.
Proportion of flora collected and identified	<p>It is anticipated that a significant proportion of the total flora present at Irvine Island has been recorded from the Study area between the April and October 2010 field assessments. It is anticipated that total flora may increase slightly following the proposed wet season survey planned for March 2011.</p> <p>Total flora has been increased by opportunistic post-fire plant taxa recorded by Onshore Environmental in the early stages of regeneration following the February 2009 wildfire at Irvine Island. These taxa are absent in long unburnt vegetation.</p> <p>The total flora at Irvine Island by Onshore Environmental during 2010 compares favourably with previous surveys completed at Irvine Island by Mattiske and Associates (2008), and at neighbouring Cockatoo and Koolan Islands.</p>
Sources of information	A flora and vegetation survey of Hardstaff Peninsula at Irvine Island was completed in 2007 (Mattiske and Associates 2008). There have also been a number of flora surveys completed at neighbouring islands (Ecologia 2004a, b; Keighery <i>et al.</i> 1995).
The proportion of the task achieved and further work which might be needed	<p>The majority of identified tasks for Level 2 flora and vegetation of the Irvine Island Study area have been completed. A full wet season survey proposed for March 2011 will be the final requirement.</p> <p>Additional work has been undertaken on neighbouring smaller islands including Bathurst, Kathleen and Flora. The availability of high resolution aerial photography would be beneficial for extending vegetation association mapping.</p>
Timing / weather / season / cycle	A short wet-season reconnaissance survey was completed in April 2010 followed by a 15 day dry season survey in October 2010. The 2010 wet season was relatively dry and it is anticipated that a proposed follow-up wet season survey in March 2011 will be beneficial to results.
Disturbances, e.g. fire, flood	The majority of vegetation is in the early stages of regeneration following an extensive wildfire in February 2009. Minor historical ground disturbance has also resulted from BHP exploration activities in the south-east corner of Irvine Island, where current exploration by Pluton Resources is also occurring.
Intensity	The entire Study area was ground truthed on a 200 m by 200 m grid as part of targeted searches and vegetation mapping during the current flora and vegetation survey. The survey intensity ensured appropriate coverage and replication within the vegetation associations described and mapped.

Constraint	Relevance
Completeness	Low rainfall during the 2010 wet season and early regeneration stage following the February 2009 wildfire reduced the completeness of the survey. A 2011 wet season survey is proposed to ensure this current gap is filled.
Resources	Appropriate resources have been applied to the survey, with two qualified botanists completing field assessments over a 17 field day period to date.
Access problems	The majority of the Study area was able to be accessed on foot from helicopter drop off points. A 200m by 200m grid pattern has been covered on foot, with access restricted to only a few excessively steep landforms where safety concerns reduced access. Three heritage sites were covered with support from the Traditional Owners who accompanied botanists into the sites.
Availability of contextual information	A number of flora and vegetation surveys have been completed by private consultants and government agencies along the chain of islands where iron ore exploration and mining has occurred, including Koolan, Cockatoo and Irvine Islands. Other broader studies have also occurred in recent years that address issues relating to flora and vegetation of islands in the Buccaneer Archipelago.
Experience levels	The two Senior Botanists working on this project have extensive experience in the Pilbara and Kimberley. Both botanists have been involved in flora and vegetation surveys on neighbouring Cockatoo and Koolan Islands in recent years (between 2004 and 2009).

### 3.3.3 Assessment of Conservation Significance

The conservation significance of flora and ecological communities are classified on a Commonwealth, State and Local level on the basis of various Acts and Agreements (*EPA Guidance Statement No. 51*, EPA 2004).

#### *Commonwealth Level:*

- *EPBC Act 1999:* The Department of Sustainability, Environment, Water, Population and Communities (DSEWPAC) lists Threatened Flora and Ecological Communities, which are determined by the Threatened Species Scientific Committee according to criteria set out in the Act (DSEWPAC 2006). The Act lists flora that are considered to be of conservation significance under one of six categories (Appendix 3).

#### *State Level:*

- *Wildlife Conservation Act 1950:* At a State level, native flora species are protected under the *Wildlife Conservation Act 1950 - Wildlife Conservation (Rare Flora) Notice*. A number of plant species are assigned an additional level of conservation significance based on a limited number of known populations and the perceived threats to these locations. Species of the highest conservation significance are gazetted Declared Rare Flora (DRF) under subsection 2 of section 23F of the *Wildlife Conservation Act 1950*. It is an offence to take or damage DRF without Ministerial approval. Section 23F of the *Wildlife Conservation Act (1950)* defines ‘to take’ as “to gather, pick, cut, pull up, destroy, dig up, remove or injure the flora or to cause or permit the same to be done by any means”.

- DEC Priority list: DEC produces a list of Priority species and ecological communities (PEC's) that have not been assigned statutory protection under the *Wildlife Conservation Act 1950*. Priority Flora are under consideration for declaration as 'Rare Flora', classified as in urgent need of further survey (Priority One to Three) or require monitoring every 5-10 years (Priority Four, see Appendix 4). The list of Priority Ecological Communities identifies those that need further investigation before nomination for Threatened Ecological Community status.

*Local Level:*

- Species may be considered of local conservation significance because of their patterns of distribution and abundance. Although not formally protected by legislation, such species are acknowledged to be in decline as a result of threatening processes, primarily habitat loss through land clearing.

# 4.0 Results

## 4.1 Desktop Review

### 4.1.1 Database Searches

A 100 km radial search from Irvine Island Study area was undertaken utilising databases maintained by EPBC and DEC to identify rare flora previously collected or identified.

There was no plant records listed on the Federal search of the EPBC database.

There were no DRF identified by the State DEC search. However, 34 Priority flora taxa were listed within a 100 km radius of Irvine Island including eight Priority 1 flora, eight Priority 2 flora, 17 Priority 3 flora, and one Priority 4 flora (Table 2).

**Table 2 Rare flora previously recorded from a 100 km radial search of Irvine Island.**  
 SCC - State Conservation Code (*Wildlife Conservation Act 1999*) and DEC (2008)

Genus	Species	SCC	Site
<i>Acacia</i>	<i>kenneallyi</i>	P3	Behind coastal dunes.
<i>Acrostichum</i>	<i>aureum</i>	P1	Wet drainage sums within spring mound.
<i>Alysicarpus</i>	<i>major</i>	P3	Brown loam over basalt.
<i>Alysicarpus</i>	<i>suffruticosus</i>	P2	Valley in sandstone.
<i>Aphyllodium</i>	<i>glossocarpum</i>	P3	
<i>Cleome</i>	<i>kenneallyi</i>	P2	Rear of foredune.
<i>Colocasia</i>	<i>esculenta</i> var. <i>aquatalis</i>	P3	In wet seepage area.
<i>Cullen</i>	<i>candidum</i>	P1	
<i>Cyperus</i>	<i>haspan</i> subsp. <i>haspan</i>	P1	In peat bank at edge of spring.
<i>Cyperus</i>	<i>victoriensis</i>	P1	
<i>Dendrolobium</i>	<i>cheelii</i>	P2	On top of waterfall above creek.
<i>Eragrostis</i>	<i>petraea</i>	P1	Permanent spring flowing slowly down slope from base of a sandstone hill
<i>Eragrostis</i>	<i>spartinoides</i>	P3	Sandy clay. Creek bank.
<i>Eriachne</i>	<i>semiciliata</i>	P3	On ridge and slope areas, in shallow soil amongst massive sandstone, in shallow soils close to mangroves.
<i>Eucalyptus</i>	<i>fitzgeraldii</i>	P2	On skeletal sandy soil over massive sandstone.
<i>Gardenia</i>	<i>gardneri</i>	P3	Hills, deep gully, SW aspect. Skeletal sandy soil on quartzite.
<i>Glycine</i>	<i>albicans</i>	P2	Undulating basalt rise.
<i>Glycine</i>	<i>pindanica</i>	P1	
<i>Goodenia</i>	<i>sepalosa</i> var. <i>glandulosa</i>	P3	
<i>Haemodorum</i>	<i>gracile</i>	P4	Sandy soil. Burnt area - sandstone.
<i>Helminthostachys</i>	<i>zeylanica</i>	P3	Margin of permanent running creek.
<i>Ipomoea</i>	sp. A Kimberley Flora (L.J. Penn 84)	P1	
<i>Jacquemontia</i>	sp. Keep River (J.L. Egan 5051)	P1	Hilltop, black sand over sandstone near watertank.
<i>Lepturus</i>	<i>repens</i>	P3	
<i>Minuria</i>	<i>macrorhiza</i>	P2	Sandstone gullies. sandstone gullies
<i>Nymphoides</i>	<i>beaglensis</i>	P2	Fresh water pools.

Genus	Species	SCC	Site
<i>Phragmites</i>	<i>karka</i>	P3	Margin of permanently wet springs on coastal plain.
<i>Phyllanthus</i>	<i>aridus</i>	P3	
<i>Pterocaulon</i>	sp. A Kimberley Flora (B.J. Carter 599)	P2	Behind salt marsh at interzone with pindan.
<i>Solanum</i>	<i>leopoldense</i>	P3	In crevices of massive King Leopold Sandstone.
<i>Spermacoce</i>	sp. Berthier Dunes (R.L. Barrett RLB 5753)	P3	In sand on beach.
<i>Styliodium</i>	<i>costulatum</i>	P3	On plain in grey-white fine sand.
<i>Trachymene</i>	<i>dusenii</i>	P3	On rocky ridge.
<i>Triodia</i>	<i>acutispicula</i>	P3	On rocky sandstone cliff top.

#### 4.1.2 Previous Surveys in the Irvine Island Area

Despite a long history of mining at neighbouring Cockatoo Island information on flora and vegetation of the island is limited to two brief surveys, the first by Martinick and Associates (1990) referred to in a Notice of Intent for mining completed by Dames and Moore (1999), and the second by ENV Australia (2007). Martinick and Associates (1990) did not record any Declared Rare Flora (DRF) or Priority flora during the 1990 field survey. ENV Australia (2007) completed a rare flora search for an exploration program proposed immediately east of the mining operation and west of the decommissioned tailings storage facility. Two Priority flora species were recorded from four locations during the survey; *Phyllanthus aridus* (P3) and *Minuria macrorhiza* (P3).

As with Cockatoo Island, nearby Koolan Island also has a long history of iron ore mining dating to the late 1940s when BHP commenced open-pit operations. However until recently, flora and vegetation survey work at Koolan Island was restricted to a single study completed over one week in February 1993 (Keighery, Gibson, Kenneally and Mitchell 1995). The 1993 survey concentrated on the eastern two thirds of Koolan Island along existing roads, formerly inhabited areas and nearby creek lines. A total of 282 plant taxa were recorded, with 43 taxa being introduced weeds principally occurring around the old settlement. Three of the weed taxa were 'Declared Weeds' listed under the *Agricultural and Related Resources Protection Act 1976 (ARRP Act)*; \**Jatropha gossypiifolia* (Bellyache Bush), \**Senna alata* (Candle Bush) and \**Cryptostegia madagascariensis* (Rubber Vine). The 1993 report was supplemented by herbarium records and collections made during an investigation of Kimberley Rainforests by Kenneally, Keighery and Hyland (1991). There was no DRF or Priority flora identified on the island at the time.

With increasing iron ore prices Aztec Resources commenced a program to re-open mining at Koolan Island in the early 1990s. As part of the approval process, baseline flora and vegetation surveys and targeted rare flora and weed surveys were completed (*ecologia Environment* 2004a, 2004b). A total of 208 plant taxa including 23 introduced weeds were recorded from three field visits in October 2003, December 2003 and February 2004. Three flora species of conservation significance were identified from Koolan Island; *Phyllanthus aridus* was widespread throughout the central part of the island; *Gymnanthera cunninghamii* was recorded from a single location; and *Brachychiton xanthophyllus* was recorded from two locations.

*Corymbia* aff. *cadophora* and *Eucalyptus kenneallyi* were identified as species of interest, but were not collected during baseline or targeted surveys.

The vegetation of Koolan Island has been mapped into nine different communities (*ecologia* Environment, 2005b):

1. Open woodland;
2. Very open woodland;
3. *Eucalyptus miniata* woodland along stony ridges;
4. *Eucalyptus miniata* / *Corymbia cadophora* woodland along moderate gullies;
5. *Callitris intratropica* forest;
6. Vine forest;
7. Mangroves;
8. Previously disturbed areas; and
9. Beaches.

The majority of the island is vegetated by open woodland in which *Eucalyptus miniata* occurs as a taller canopy, with the lower bloodwoods *Corymbia confertiflora* and *Corymbia cadophora* subsp. *cadophora* occurring at variable densities below with a mixed herb ground cover. Very small areas of rainforest or vine thickets occur in limited locations. Rainforest and vine thickets intergrade into *Callitris intratropica* forest at the bases of several deep gullies. The *Callitris intratropica* forest is restricted to the more deeply incised gullies and often occurs in sporadic stands. Mangroves occur extensively at the intertidal zone but are largely restricted to narrow strips of vegetation, with only a few of the larger inlets supporting substantive areas. There are twelve small beaches that predominantly occur adjacent to mangrove communities but with some mobile sands. The overstorey consists of scattered shrubs and the rest of the complex is mainly comprised of grasses and creepers.

Formal flora and vegetation assessment of Irvine Island is restricted to surveys commissioned by Strategen Environmental Consultants on behalf of Pluton Resources, in June 2007 and September 2007 (Mattiske 2008). However, it is noted that records for 44 plant taxa were held by the Western Australian State Herbarium from Irvine Island prior to the 2007 survey (DEC 2008). Mattiske (2008) recorded a total of 86 plant taxa from drill site locations at Hardstaff Peninsula, Isthmus Point, adjacent areas and opportunistic collections. One introduced (weed) species was recorded during the survey; *\*Passiflora foetida*. There were no DRF or Priority flora located during the survey. Fourteen vegetation associations were described from the Study area, with vegetation condition rated as ‘Pristine’ to ‘Excellent’. No Threatened Ecological Communities (TEC’s) or Priority Ecological Communities (PEC’s) were observed in the survey area (Mattiske 2008).

## 4.2 Flora Species

A total number of 172 plant taxa (including varieties and subspecies) from 55 families and 120 genera were recorded from Hardstaff Peninsula during the three day reconnaissance survey between the 8<sup>th</sup> and 10<sup>th</sup> April 2010 (see Appendix 5). Species representation was greatest among the Fabaceae, Poaceae, Malvaceae, Myrtaceae, Cyperaceae, Convolvulaceae, Euphorbiaceae and Proteaceae families (Table 3).

The 14 day dry season survey that covered Irvine Island, Flora Island, and parts of Bathurst Island and Kathleen Island between the 13<sup>th</sup> and 26<sup>th</sup> October 2010, recorded 204 plant taxa (including varieties and subspecies) from 62 families and 142 genera. Species representation was greatest among the Fabaceae, Malvaceae, Poaceae, Myrtaceae, Convolvulaceae, Proteaceae, Cyperaceae, Apocynaceae, Phyllanthaceae and Euphorbiaceae families (Table 3).

**Table 3 Statistics for total flora recorded from the Irvine Island Study area - April and October 2010 assessments completed by Onshore Environmental.**

Parameter	April 2010	October 2010
No. Families	55	58

## 4.3 Conservation Significant Flora Species

Following intensive quadrat sampling and extensive ground truthing of the Study area by two experienced botanists, no plant taxa gazetted as Declared Rare Flora pursuant to subsection (2) of section 23F of the *Wildlife Conservation Act (1950)*, or listed under the *EPBC Act 1999*, were recorded.

There were three Priority flora species recorded during the April and October 2010 field surveys; *Ipomoea* sp. A Kimberley Flora (L.J. Penn 84), *Phyllanthus aridus* and *Haemodorum gracile*.

*Ipomoea* sp. A Kimberley Flora (L.J. Penn 84) is a Priority 1 flora taxon recorded from a single location within the Study area (Study Site 12) in April 2010; it could not be re-located during the October 2010 survey owing to the dry conditions. It was growing in light brown loam soils amongst sandstone outcropping on middle hill slopes, occurring as regrowth to 25 cm in height and described as a minor component of the vegetation. *Ipomoea* sp. A Kimberley Flora (L.J. Penn 84) is a perennial with creeping or twining stems and simple leaves, previously recorded from pindan woodland north of Broome. A targeted search for *Ipomoea* sp. A Kimberley Flora (L.J. Penn 84) will be undertaken during the proposed wet season survey in March 2011, aimed at increasing the known distribution of this taxon on Irvine Island and potentially on neighbouring islands.

*Phyllanthus aridus* is a Priority 3 flora taxon recorded from four closely occurring points on the central western fringe of Irvine Island in October 2011 (Figure 4). It was growing on moderately steep hill slopes above a minor gully and ephemeral drainage channel. Soil was a dark brown sandy loam amongst outcropping sandstone. *Phyllanthus aridus* is an erect, much-branched shrub that grows to 0.5 m high (Plate 1). It is characterised by small, inconspicuous cream and green coloured, male and female flowers. It flowers and fruits from March to August. The species is often found on sandstones, occurring from the King Edward River and Cockburn Range southwards to Camballin. It is also found on Augustus, Cockatoo and Koolan Islands.

*Haemodorum gracile* is a Priority 4 flora taxon recorded from four sites on Hardstaff Peninsula in April 2010, and a further 22 sites from the larger Irvine Island Study area in October 2010 (Figure 3, Appendix 6). A further eleven sites were recorded from Bathurst, Kathleen and Flora Islands. *Haemodorum gracile* occurred as scattered plants on sandstone ridges and upper slopes. It occurred predominantly within Vegetation Association 7a ‘Low Open Heath (to Low Closed Heath) of *Scaevola macrostachya*, *Grevillea wickhamii* subsp. *wickhamii*, *Distichostemon hispidulus* var. *aridus*’ but was never a common or dominant component of the vegetation. *Haemodorum gracile* is a bulbaceous perennial herb growing to between 0.4 m and 0.65 m in height (Plate 2). It is apparently endemic to the Kimberley Region occurring from the Mitchell Plateau south west to the Dampier Peninsula (Wheeler et

al. 1992). It has previously been recorded in white or red sand or sandy clay, and flowers between August and November.

Management of Priority flora identified at Irvine Island may include the following strategies:

- The location of Priority flora species and their habitat will be recorded on a GIS database and incorporated into mine planning. These records will be updated as necessary and awareness of these records will be promoted at mine planning and operational levels;
- The layout of infrastructure and mine landforms will be designed to minimise impact of Priority flora;
- Specific training in Priority flora management will be provided to all Pluton Resources personnel and contractors through the site induction;
- ‘Enviro Alert’ information sheets outlining management of Priority flora species (and weeds) will be prepared and distributed to increase awareness amongst employees and contractors;
- Research into propagation techniques for Priority flora species will be initiated and may include collection of seed and/or cuttings and root divisions from site;
- Translocation of plants will occur into similar habitats where Priority flora species are situated within areas where disturbance cannot be avoided; and
- There will be a regular review of development of State and Commonwealth flora management strategies and action plans, and developments in flora management methods in the Mineral Resources Industry, by keeping abreast of relevant literature and consultation with the DEC.

**Plate 1 *Phyllanthus aridus* (Priority 3).**

**Plate 2 *Haemodorum gracile* (Priority 4).**

**Range Extensions**

Based on current records listed in Florabase eleven plant taxa recorded from the Irvine Island Study area show range extensions (Table 4).

**Table 4** Range extensions noted for flora recorded from the Irvine Island Study area in April and October 2010.

Taxon	Status
<i>Cajanus scarabaeoides</i> var. <i>pedunculatus</i> (Fabaceae)	Small range extension to the north-west
<i>Cullen virens</i> (Fabaceae)	Range extension to the west
<i>Decaisnina signata</i> subsp. <i>cardiophylla</i> (Loranthaceae)	Range extension to the south-west
<i>Dendrobium affine</i> (Orchidaceae)	Range extension to the south-west
<i>Fimbristylis leucocolea</i> (Cyperaceae)	Range extension to the north-west
<i>Fimbristylis schultzii</i> (Cyperaceae)	Range extension to the west
<i>Flemingia parviflora</i> (Fabaceae)	Range extension to the west
<i>Marsdenia pleiadenia</i> (Apocynaceae)	Range extension to the west
<i>Tephrosia laxa</i> var. <i>angustata</i> (Fabaceae)	Range extension to the north-west
<i>Tephrosia</i> sp. E Kimberley Flora (C.A. Gardner 9937) (Fabaceae)	Range extension to the west
<i>Tephrosia subpectinata</i> (Fabaceae)	Range infill to the north west

## 4.4      Introduced Flora

There were two introduced (weed) species recorded from the Irvine Island Study area in April and October 2010 (Figure 4, Appendix 7); *\*Passiflora foetida* var. *hispida* (Wild Passionfruit) and *\*Melinis repens* (Blanketgrass). Neither taxon is listed as a Declared Weed under the *Agriculture and Related Resources Protection Act, 1976* (ARRP Act).

*\*Passiflora foetida* var. *hispida* (Wild Passionfruit, see Plate 1) was recorded from 117 sites in April and October 2010, distributed across the entire Irvine Island Study area (Figure 4, Appendix 7). *\*Passiflora foetida* var. *hispida* (Mossy Passion Flower; Love in a Mist Passion Flower; Wild Passionfruit) is a woody climber / vine (with an unpleasant smell) growing to 9 m high. The flower colour ranges from cream to white to blue, with flowering occurring between February and November. It grows in disturbed native vegetation amongst medium sized trees, or less commonly in herblands and vine thickets. Its seeds are believed to be spread by birds. Wild Passionfruit occurs in a range of coastal habitats including coastal dunes, river and creek banks, gorges, rocky slopes, hill slopes and valley plains. The preferred soil types range from rocky or stony soil, gravelly soil, sand, loam and clay. *\*Passiflora foetida* var. *hispida* is native to the West Indies and South America. It has been introduced to Western Australia, Northern Territory, Queensland and New South Wales.

*\*Melinis repens* (Blanketgrass, Holme's Grass, Natal Grass, Natal Redtop, Red Natal Grass, Ruby Grass) was recorded from five collection locations distributed along the western and central sectors of Irvine Island (Figure 4), preferring larger ephemeral drainage lines. Blanketgrass was recorded as scattered plants to approximately 0.8 m in height. It is a tufted annual or perennial grass / herb up to 1.2 m in height and flowering (red, purple) between July and April. *\*Melinis repens* originates from South Africa, parts of the Mediterranean, India, and North Africa. In its native range it occurs in disturbed open habitats, often forming large stands. It is widely distributed outside its native range, germinating and growing under a wide range of temperature conditions. It is becoming increasingly common along road and rail verges in the southwest of Western Australia, with other confirmed locations around Geraldton in the mid west, and extending north of Broome into the Kimberley.

## 4.5 Vegetation Communities of Interest

A vegetation association is considered a Threatened Ecological Community (TEC) if it is found to fit into one of the following categories:

- Presumed Totally Destroyed;
- Critically Endangered;
- Endangered; or
- Vulnerable.

Threatened species and ecological community conservation is coordinated by DEC's Nature Conservation Division, primarily through the Western Australian Threatened Species and Associations Unit (WATSCU). No State legislation deals specifically with TECs. However, TECs can be listed as nationally threatened and are protected under the EPBC Act (1999).

A search of the EPBC database confirmed there were no Federal listed TEC's previously recorded within a 100 km radius of Irvine Island. A search of the State database completed by DEC confirmed there was one State-listed TEC recorded from the mainland between 60 km and 100 km southwest of the Study area; 'Monsoon (vine) thickets on coastal sand dunes of Dampier Peninsula', listed as Vulnerable. Field assessment confirmed that the PEC did not occur within the Irvine Island Study area. The rainforest patches noted within Vegetation Association 2a are dissimilar to the 'Monsoon (vine) thickets on coastal sand dunes of Dampier Peninsula'.

In addition to TEC's, DEC has generated a list of Priority Ecological Communities (PEC) occurring in the Kimberley. The list identifies communities that require further investigation prior to nomination for TEC status. A search completed by the DEC identified one PEC previously recorded on the mainland between 60 km and 100 km to the southwest of Irvine Island; 'Assemblages of Lolly Well Springs wetland complex (Priority 3)'. Field assessment confirmed that the PEC did not occur within the Irvine Island Study area.

In addition to TEC's and PEC's the DEC (2009) identify mangroves, riparian forests and rainforest patches as 'special landscapes and ecosystems', with the ability to act as resource centres for distinct faunas, including wide-ranging vagile species that are dependent on the archipelago of patches, e.g. rainbow pittas, fruit pigeons, and flying foxes. They also provide dry season refuges for a variety of savanna animals, and have numerous endemic species. Laterite rainforests are of particular interest. Mangrove and rainforest patches were recorded on Irvine Island, and are discussed in more detail below.

- There were three mangrove associations recorded and mapped around the coastal fringe of Irvine Island; Vegetation Associations 1a, 1b and 1c (described in Section 4.6). The species composition of the three associations was controlled largely by subtle changes in landscape position which influenced the level of salinity and inundation. Species richness for the mangrove associations was low and none of the plant taxa were determined to be of conservation significance. Similar mangrove associations have previously been recorded at neighbouring Cockatoo and Koolan Islands (Ecologia Environment 2004b).

- Small rainforest patches were recorded on steep sided valleys along a large ephemeral drainage line associated with Vegetation Association 2a at Irvine Island. These ‘patches’ were often difficult to differentiate from surrounding vegetation owing to their small size, and the impact of recent wildfire. None of the associated flora was determined to be of conservation significance. Similar rainforest patches have previously been recorded at nearby Koolan Island (Ecologia Environment 2004b).

## 4.6 Vegetation

Wildfire resulting from lightning strike occurred at Irvine Island in February 2009 following an extended absence of fire for approximately 20 years. Heavy fuel loads resulted in a hot burn that extended across the majority of the island and impacted all vegetation strata except mangrove communities and a small peninsula separated from the main island by an intertidal zone. In April 2010 the canopy layer supported a flush of new growth that was fast approaching pre-burn foliage cover, and there was dense regeneration of the <1m understorey stratum in most parts of the island. A small peninsula located directly west of the exploration camp and separated from the mainland by mangroves (intertidal zone) remained unburnt in April 2010, and was surveyed to provide a comparison with the larger (burnt) Study area. While the wildfire did alter vegetation structure and composition in the short to medium term, it also provided the opportunity to record opportunistic annual and ephemeral plant taxa that may only occur in the early growing seasons following fire.

By October 2010 the post-burn canopy foliage cover had reestablished across the majority of Irvine Island and provided similar ground cover to corresponding long unburnt vegetation associations on neighbouring islands. The midstorey stratum had also increased in cover since the April 2010 assessment, and was generally comparable or in some cases provided higher ground coverage than corresponding long unburnt vegetation associations on neighbouring islands. While regeneration of the hummock grassland was evident at Irvine Island coverage remained lower in comparison to neighbouring long unburnt vegetation. It is anticipated that hummock grasses will become a progressively more dominant component of the vegetation in future years if fire is excluded.

In October 2010, a total of 17 vegetation associations were described and mapped from the Irvine Island Study area (Figures 5a-5g). The vegetation associations have been classified into nine Broad Floristic Formations on the basis of canopy structure (Table 5). Raw data for the 100 study sites (quadrats) is presented in Appendix 8.

**Table 5** Vegetation descriptions for 17 vegetation associations (from nine Broad Floristic Formations) mapped within the Irvine Island Study area, October 2010.

BROAD FLORISTIC FORMATION		Landform
Vegetation Association		
<b>1 LOW CLOSED FOREST</b>		
1a	Low Closed Forest of <i>Sonneratia alba</i>	Mangrove - ocean side
1b	Low Closed Forest of <i>Rhizophora stylosa</i> and <i>Avicennia marina</i>	Mangrove - mixed
1c	Low Closed Forest of <i>Rhizophora stylosa</i>	Mangrove - landward side
1d	Low Closed Forest of <i>Pandanus spiralis</i>	Freshwater Seepage
<b>2 LOW OPEN FOREST</b>		
2a	Low Open Forest (to Low Closed Forest) of <i>Canarium australianum</i> var. <i>australianum</i> , <i>Sersalisia sericea</i> , <i>Mimusops elengi</i> , <i>Brachychiton diversifolius</i> subsp. <i>diversifolius</i> over Very Open Tussock Grassland of <i>Sorghum plumosum</i>	Large Ephemeral Drainage Line
2b	Low Open Forest of <i>Eucalyptus</i> cf. <i>miniata</i> , <i>Eucalyptus tectifica</i> , <i>Corymbia cadophora</i> subsp. <i>cadophora</i> over Low Shrubland of <i>Acacia wickhamii</i> subsp. <i>wickhamii</i> , <i>Scaevola macrostachya</i> , <i>Microstachys chamaelea</i> over Tussock Grassland of <i>Chrysopogon latifolius</i> , <i>Sorghum plumosum</i>	Moderate to Steep Hill Slope, Ridge
<b>3 WOODLAND</b>		
3a	Woodland of <i>Eucalyptus miniata</i> over Shrubland of <i>Calytrix exstipulata</i> , <i>Acacia wickhamii</i> subsp. <i>wickhamii</i> , <i>Flueggea virosa</i> subsp. <i>melanthesoides</i> over Closed Hummock Grassland of <i>Triodia bynoei</i>	Unburnt Hill Slope
<b>4 OPEN WOODLAND</b>		
4a	Open Woodland of <i>Eucalyptus</i> cf. <i>miniata</i> over Low Woodland of <i>Eucalyptus</i> cf. <i>miniata</i> , <i>Corymbia cadophora</i> subsp. <i>cadophora</i> over Low Closed Heath of <i>Acacia hippuroides</i> , <i>Gonocarpus leptothecus</i> , <i>Microstachys chamaelea</i> with Very Open Tussock Grassland of <i>Sorghum plumosum</i>	Plateau
4b	Open Woodland of <i>Eucalyptus</i> cf. <i>miniata</i> over Low Woodland of <i>Eucalyptus</i> cf. <i>miniata</i> , <i>Corymbia cadophora</i> subsp. <i>cadophora</i> over Open Shrubland of <i>Grevillea wickhamii</i> subsp. <i>wickhamii</i> , <i>Buchanania oblongifolia</i> , <i>Grevillea refracta</i> subsp. <i>refracta</i> over Low Open Heath of <i>Distichostemon hispidulus</i> var. <i>aridus</i> , <i>Scaevola macrostachya</i> , <i>Gonocarpus leptothecus</i> over Open Hummock Grassland of <i>Triodia bynoei</i>	Upper Hill Slope, Ridge Crest

<b>5</b>	<b>LOW WOODLAND</b>	
5a	Low Woodland of <i>Corymbia confertiflora</i> , <i>Eucalyptus tectifica</i> over Open Shrubland of <i>Grevillea agrifolia</i> subsp. <i>agrifolia</i> , <i>Flueggea virosa</i> subsp. <i>melanthesoides</i> over Very Open Hummock Grassland of <i>Triodia bynoei</i> in saddles of range, with Low Open Shrubland of <i>Calytrix exstipulata</i> , <i>Calytrix brownii</i> , <i>Buchanania oblongifolia</i> over Very Open Hummock Grassland of <i>Triodia bynoei</i> on peaks	Mosaic - Ironstone Peak & Saddle
<b>6</b>	<b>LOW OPEN WOODLAND</b>	
6a	Low Open Woodland of <i>Eucalyptus tectifica</i> , <i>Corymbia confertiflora</i> , <i>Corymbia cadophora</i> subsp. <i>cadophora</i> , <i>Corymbia polycarpa</i> over Shrubland of <i>Grevillea agrifolia</i> subsp. <i>agrifolia</i> , <i>Grevillea refracta</i> subsp. <i>refracta</i> , <i>Buchanania oblongifolia</i> over Low Open Heath of <i>Scaevola macrostachya</i> , <i>Distichostemon hispidulus</i> var. <i>aridus</i> , <i>Acacia wickhamii</i> subsp. <i>wickhamii</i>	Mid to Upper Hill Slope
6b	Low Open Woodland of <i>Corymbia confertiflora</i> , <i>Ficus platypoda</i> over High Open Shrubland of <i>Calytrix exstipulata</i> , <i>Verticordia verticillatus</i> , <i>Buchanania obovata</i> , <i>Grevillea refracta</i> subsp. <i>refracta</i> over Open Hummock Grassland of <i>Triodia bynoei</i> , <i>Triodia pungens</i>	Moderate to Steep Hill Slope
6c	Low Open Woodland of <i>Corymbia confertiflora</i> over Open Shrubland of <i>Buchanania oblongifolia</i> , <i>Grevillea wickhamii</i> subsp. <i>wickhamii</i> over Low Open Heath of <i>Scaevola macrostachya</i> , <i>Acacia wickhamii</i> subsp. <i>wickhamii</i> , <i>Distichostemon hispidulus</i> var. <i>aridus</i>	Hill Slope
6d	Low Open Woodland of <i>Corymbia cadophora</i> subsp. <i>cadophora</i> , <i>Corymbia confertiflora</i> over Open Shrubland of <i>Grevillea wickhamii</i> subsp. <i>wickhamii</i> , <i>Buchanania oblongifolia</i> over Low Open Shrubland of <i>Triumfetta incana</i> , <i>Calytrix brownii</i> over Very Open Hummock Grassland of <i>Triodia bynoei</i> , <i>Triodia pungens</i>	Exposed Sandstone Ridge, Narrow Ephemeral Drainage Line
<b>7</b>	<b>LOW OPEN HEATH</b>	
7a	Low Open Heath (to Low Closed Heath) of <i>Scaevola macrostachya</i> , <i>Grevillea wickhamii</i> subsp. <i>wickhamii</i> , <i>Distichostemon hispidulus</i> var. <i>aridus</i>	Sandstone Hill crest, Hill slope, Peninsula
<b>8</b>	<b>SCATTERED SHRUBS</b>	
8a	Scattered Shrubs of <i>Ficus platypoda</i> over Low Open Shrubland of <i>Cajanus cinereus</i> , <i>Calytrix exstipulata</i> , <i>Corchorus fascicularis</i> over Very Open Hummock Grassland of <i>Triodia bynoei</i> , <i>Triodia pungens</i>	Cliff Face
<b>9</b>	<b>TUSSOCK GRASSLAND</b>	
9a	Tussock Grassland of <i>Spinifex longifolius</i>	Foredune

## 1 Low Closed Forest

### 1a Low Closed Forest of *Sonneratia alba*

**Quadrats Sampled:** 22

#### **Location and Landform**

Three mangrove associations were differentiated along the coastline of Irvine Island. These were associated with localised areas of accumulated silt within the intertidal zone of small embayments.

Vegetation Association 1a primarily occupied the low intertidal zone of small enclaves and estuaries, generally where the habitat was exposed to the open ocean. Mangrove species that inhabit this association characteristically have their lower trunks, roots and pneumatophores regularly inundated more than 45 times a month (Duke 2006). They are generally constricted by salinity levels (inland, midstream, and downstream) and inundation levels (high, mid and low). The mangroves at Irvine Island are considered to be downstream, or high salinity, populations.

Vegetation Association 1a was dominated by a single species; *Sonneratia alba* (Family Sonneratiaceae), which occurs in the ‘low’ intertidal zone, provided approximately 80% cover and reached between 7m to 15m in height. Other associated mangrove species included *Avicennia marina*, *Rhizophora stylosa* and *Aegiceras corniculatum*, though these were minor components of the vegetation. Vegetation condition was rated as ‘pristine’ to ‘excellent’.

#### **Vegetation Structure and Floristics**

Tallest tree stratum:           *Sonneratia alba*

Minor tree components:     *Avicennia marina*,   *Rhizophora stylosa*,   *Aegiceras corniculatum*

## 1b Low Closed Forest of *Rhizophora stylosa* and *Avicennia marina*

Quadrats Sampled: 82

### Location and Landform

Vegetation Association 1b was described as a mixed species mangrove community occurring between the more distinctive units occurring on the ocean-side (Vegetation Association 1a) and landward side (Vegetation Association 1c) of large embayments.

Vegetation Association 1b comprised a mosaic of mangrove species with the most common species typically being *Rhizophora stylosa*, *Sonneratia alba* and *Avicennia marina* forming a Low Closed Forest, with less common taxa including *Aegiceras corniculatum*, *Aegialitis annulata* and *Camptostemon schultzii*. Vegetation condition was rated as 'pristine' to 'excellent'.

### Vegetation Structure and Floristics

Tallest tree stratum	<i>Rhizophora stylosa</i> , <i>Avicennia marina</i> , <i>Sonneratia alba</i>
	<i>Aegiceras corniculatum</i> , <i>Aegialitis annulata</i> ,
Minor tree components:	<i>Camptostemon schultzii</i>

### 1c Low Closed Forest of *Rhizophora stylosa*

Quadrats Sampled: 31, 43

#### Location and Landform

Vegetation Association 1c was mapped as the distinctive landward band of mangroves occurring within the mid intertidal zone of larger embayments. Vegetation Association 1c was dominated by a single species, *Rhizophora stylosa*, which provided up to 98% cover. *Avicennia marina* was recorded as a minor component in the vegetation. Vegetation condition was rated as ‘pristine’ to ‘excellent’.

#### Vegetation Structure and Floristics

Tallest tree stratum: *Rhizophora stylosa*

Minor tree components: *Avicennia marina*

## 1d Low Closed Forest of *Pandanus spiralis*

**Quadrats Sampled:** 8, 19, 35, 70

**Area:** 5.5 ha or 0.6%

### Location and Landform

Vegetation Association 1d was habitat-specific associated with areas supporting a freshwater source close to the surface including swales at the base of hills and gullies, water holes, and fissures in steep cliff lines. The unit was restricted to the coastal fringe of the Study area. Soils were a brown sandy loam, with basement sandstone represented as surface boulders and cobbles. Vegetation was dominated by *Pandanus spiralis* occurring as a tree or tall shrub up to 12 m in height, with and without *Canarium australianum* var. *australianum* and *Corymbia confertiflora*. Minor components of the vegetation typically included species represented in surrounding associations. Vegetation condition was rated as 'excellent' with minor disturbances related to recent fire and presence of \**Passiflora foetida*.

### Vegetation Structure and Floristics

Tallest tree stratum:	<i>Pandanus spiralis</i> , <i>Canarium australianum</i> var. <i>australianum</i> , <i>Corymbia confertiflora</i> , <i>Sersalisia sericea</i> , <i>Brachychiton diversifolius</i> subsp. <i>diversifolius</i>
Tallest shrub layer:	<i>Ficus aculeata</i> , <i>Hakea arborescens</i> , <i>Flueggea virosa</i> subsp. <i>melanthesoides</i> , <i>Acacia multisiliqua</i> , <i>Brachychiton viridiflorus</i>
Next Shrub Layer:	<i>Microstachys chamaelea</i> , <i>Distichostemon hispidulus</i>
Tallest ground species:	<i>Sorghum plumosum</i> , <i>Cenchrus elymoides</i> var. <i>elymoides</i>
Climbers:	<i>Asparagus racemosus</i> , * <i>Passiflora foetida</i> var. <i>hispida</i> , <i>Flagellaria indica</i>
Creepers:	<i>Xenostegia tridentata</i> , <i>Galactia tenuiflora</i>

## 2 Low Open Forest

- 2a Low Open Forest (to Low Closed Forest) of *Canarium australianum* var. *australianum*, *Sersalisia sericea*, *Mimusops elengi*, *Brachychiton diversifolius* subsp. *diversifolius* over Very Open Tussock Grassland of *Sorghum plumosum*

Quadrats Sampled: 13, 49, 52, 58, 65, 71, 74, 99

Area: 53.4 ha or 5.6%

### Location and Landform

Vegetation Association 2a occurred along a major unincised drainage line (and adjacent steep sided valleys) extending north-west to south-east through the entire central sector of Irvine Island. It was also recorded in localised gullies and steep hill slope habitats to the south and east of this drainage line. Localised areas within this association were defined as rainforest patches. The brown loam soils were of sandstone origin, with outcropping and surface cobbles and pebbles present. The Low Open Forest (to Low Closed Forest) canopy defined Vegetation Association 2a, with *Canarium australianum* var. *australianum*, *Sersalisia sericea*, *Mimusops elengi* and *Brachychiton diversifolius* subsp. *diversifolius* common tree taxa occurring with a suite of other tree species. The understorey strata were generally sparse under the dense canopy cover, however, climbers were well represented; *Tinospora smilacina*, *Asparagus racemosus*, \**Passiflora foetida* var. *hispida*, *Flagellaria indica*. Vegetation condition was rated as 'excellent' with disturbance restricted to impacts from recent fire and the introduction of \**Passiflora foetida* var. *hispida*.

### Vegetation Structure and Floristics

Tallest tree stratum:	<i>Canarium australianum</i> var. <i>australianum</i> , <i>Sersalisia sericea</i> , <i>Mimusops elengi</i> , <i>Brachychiton diversifolius</i> subsp. <i>diversifolius</i> <i>Eucalyptus miniata</i> , <i>Corymbia confertiflora</i> , <i>Eucalyptus tectifica</i> , <i>Corymbia polycarpa</i> , <i>Hakea arborescens</i> , <i>Melochia umbellata</i>
Tallest shrub layer:	<i>Flueggea virosa</i> subsp. <i>melanthesoides</i> , <i>Microstachys chamaelea</i> , <i>Melhania oblongifolia</i>
Tallest ground species:	<i>Sorghum plumosum</i> , * <i>Melinis repens</i> , <i>Cenchrus elymoides</i> var. <i>elymoides</i> , <i>Panicum seminudum</i> , <i>Chrysopogon latifolius</i>
Climbers:	<i>Tinospora smilacina</i> , <i>Asparagus racemosus</i> , * <i>Passiflora foetida</i> var. <i>hispida</i> , <i>Flagellaria indica</i>
Creepers:	<i>Ipomoea eriocarpa</i> , <i>Galactia tenuiflora</i> , <i>Ampelocissus acetosa</i>
Herbs:	<i>Trachymene didiscoides</i> , <i>Chrystia australasica</i> , <i>Dicliptera armata</i>

- 2b Low Open Forest of *Eucalyptus* cf. *miniata*, *Eucalyptus tectifica*, *Corymbia cadophora* subsp. *cadophora* over Low Shrubland of *Acacia wickhamii* subsp. *wickhamii*, *Scaevola macrostachya*, *Microstachys chamaelea* over Tussock Grassland of *Chrysopogon latifolius*, *Sorghum plumosum***

**Quadrats Sampled:** 21, 25, 39, 41, 42, 78, R2, R3

**Area:** 103.0 ha or 10.8%

#### **Location and Landform**

Vegetation Association 2b occurred predominantly at the northern and southern sectors of the Study area, with smaller areas also recorded to the east and west. Vegetation was typically associated with grey brown sandy loam soils on moderate to steep hill slopes (and associated ridges) located at the edge of the extensive plateau supporting Vegetation Association 4a. Vegetation was characterised by the occurrence of *Eucalyptus tectifica* with *Eucalyptus* cf. *miniata* forming Low Open Forest, and *Chrysopogon latifolius* and/or *Sorghum plumosum* forming Tussock Grassland. Vegetation condition was rated as 'excellent'.

#### **Vegetation Structure and Floristics**

Tallest tree stratum:	<i>Eucalyptus</i> cf. <i>miniata</i> , <i>Eucalyptus tectifica</i> , <i>Corymbia cadophora</i> subsp. <i>cadophora</i> , <i>Corymbia polycarpa</i> , <i>Canarium australianum</i> var. <i>australianum</i> , <i>Corymbia confertiflora</i> , <i>Brachychiton diversifolius</i> subsp. <i>diversifolius</i>
Tallest shrub layer:	<i>Calytrix exstipulata</i> , <i>Santalum lanceolatum</i> , <i>Flueggea virosa</i> subsp. <i>melanthesoides</i> , <i>Buchanania oblongifolia</i> , <i>Grevillea refracta</i> subsp. <i>refracta</i> , <i>Brachychiton viscidulus</i>
Next Shrub Layer:	<i>Acacia wickhamii</i> subsp. <i>wickhamii</i> , <i>Scaevola macrostachya</i> , <i>Microstachys chamaelea</i> , <i>Templetonia hookeri</i> , <i>Distichostemon hispidulus</i> , <i>Grevillea agrifolia</i> subsp. <i>agrifolia</i> , <i>Triumfetta incana</i>
Tallest ground species:	<i>Chrysopogon latifolius</i> , <i>Sorghum plumosum</i> , <i>Triodia bynoei</i>
Herbs:	<i>Gonocarpus leptothecus</i> , <i>Trachymene didiscoides</i> , <i>Cleome viscosa</i>

### 3 Woodland

- 3a Woodland of *Eucalyptus miniata* over Shrubland of *Calytrix exstipulata*, *Acacia wickhamii* subsp. *wickhamii*, *Flueggea virosa* subsp. *melanthesoides* over Closed Hummock Grassland of *Triodia bynoei*

Quadrats Sampled: 10

Area: 7.9 ha or 0.8%

#### Location and Landform

Vegetation Association 3a was associated with a long unburnt peninsula in the central southern sector of the Study area, separated from the larger island by mangroves. Soil was a light brown loam derived from sandstone, with sandstone boulders outcropping extensively across the entire unit. Bare ground was less than 2% owing to the ‘very old’ fire age and prominence of the Closed Hummock Grassland. Vegetation condition was rated as ‘excellent’, although there was evidence of historical BHP exploration activities at the northern extent of the peninsula.

#### Vegetation Structure and Floristics

Tallest tree stratum:	<i>Eucalyptus miniata</i> , <i>Eucalyptus tectifica</i>
Tallest shrub layer:	<i>Buchanania oblongifolia</i> , <i>Mimusops elengi</i> , <i>Eucalyptus tectifica</i> , <i>Exocarpos latifolius</i> , <i>Canarium australianum</i> var. <i>australianum</i>
Next Shrub Layer:	<i>Calytrix exstipulata</i> , <i>Acacia wickhamii</i> , <i>Flueggea virosa</i> subsp. <i>melanthesoides</i> , <i>Templetonia hookeri</i> , <i>Grevillea wickhamii</i> , <i>Distichostemon hispidulus</i> , <i>Clerodendrum floribundum</i> var. <i>coriaceum</i>
Tallest ground species:	<i>Triodia bynoei</i>

#### 4 Open Woodland

- 4a Open Woodland of *Eucalyptus* cf. *miniata* over Low Woodland of *Eucalyptus* cf. *miniata*, *Corymbia cadophora* subsp. *cadophora* over Low Closed Heath of *Acacia hippuroides*, *Gonocarpus leptothecus*, *Microstachys chamaelea* with Very Open Tussock Grassland of *Sorghum plumosum*

**Quadrats Sampled:** 14, 24, 45, 51, 55, 56, 57, 62, 63, 64, 66, 68, 75, 76, 77, R5

**Area:** 270.4 ha or 28.5%

##### Location and Landform

Vegetation Association 4a was the most extensive unit represented at Irvine Island, covering 270.4 ha or 28.5% of the Study area. Vegetation was associated with grey / brown sandy loam soils extending over an expansive elevated plateau. The sandstone baserock outcropped prominently, with small boulders and cobbles present throughout. Vegetation was characterised by the dominance of the low to mid shrub *Acacia hippuroides*, which formed the dominant vegetation stratum Low Closed Heath. Bare ground was estimated at <10%. Vegetation condition was rated as 'excellent'.

##### Vegetation Structure and Floristics

Tallest tree stratum:	<i>Eucalyptus miniata</i> , <i>Corymbia cadophora</i> subsp. <i>cadophora</i> , <i>Corymbia confertiflora</i> , <i>Eucalyptus tectifica</i>
Tallest shrub layer:	<i>Calytrix exstipulata</i> , <i>Buchanania oblongifolia</i> , <i>Hakea arborescens</i> , <i>Grevillea pyramidalis</i> subsp. <i>pyramidalis</i>
Next Shrub Layer:	<i>Acacia hippuroides</i> , <i>Microstachys chamaelea</i> , <i>Scaevola macrostachya</i> , <i>Distichostemon hispidulus</i> , <i>Cajanus cinereus</i> , <i>Goodenia sepalosa</i> var. <i>sepalosa</i> , <i>Acacia oligoneura</i> , <i>Grevillea agrifolia</i> subsp. <i>agrifolia</i> , <i>Templetonia hookeri</i> , <i>Acacia wickhamii</i> subsp. <i>wickhamii</i>
Tallest ground species:	<i>Sorghum plumosum</i> , <i>Triodia bynoei</i>
Climbers:	<i>Ampelocissus acetosa</i>
Herbs:	<i>Gonocarpus leptothecus</i> , <i>Stackhousia intermedia</i> , <i>Trachymene didiscoides</i>

4b Open Woodland of *Eucalyptus* cf. *miniata* over Low Woodland of *Eucalyptus* cf. *miniata*, *Corymbia cadophora* subsp. *cadophora* over Open Shrubland of *Grevillea wickhamii* subsp. *wickhamii*, *Buchanania oblongifolia*, *Grevillea refracta* subsp. *refracta* over Low Open Heath of *Distichostemon hispidulus* var. *aridus*, *Scaevola macrostachya*, *Gonocarpus leptothecus* over Open Hummock Grassland of *Triodia bynoei*

**Quadrats Sampled:** 4, 5, 12, 28, 29, 32, 72

**Area:** 125.1 ha or 13.2%

#### Location and Landform

Vegetation Association 4b was mapped across the southern sector of the Study area, including Hardstaff Peninsula and Isthmus Point. Vegetation was associated with grey / brown loam soils on mid and upper hill slopes and ridges. The base rock was sandstone with outcropping evident and surface cobbles and pebbles common. Bare ground was estimated at between 10% and 25%. Vegetation was differentiated from Vegetation Association 4a by the composition of understorey strata, particularly the reduced dominance of the low shrub *Acacia hippuroides* replaced by a variety of cosmopolitan low and mid shrub taxa; *Distichostemon hispidulus* var. *aridus*, *Scaevola macrostachya*, *Acacia multisiliqua*, *Grevillea agrifolia* subsp. *agrifolia*, *Templetonia hookeri*. Vegetation condition was rated as 'excellent'.

#### Vegetation Structure and Floristics

Tallest tree stratum:	<i>Eucalyptus miniata</i> , <i>Eucalyptus tectifica</i> , <i>Corymbia cadophora</i> subsp. <i>cadophora</i> , <i>Corymbia confertiflora</i>
Tallest shrub layer:	<i>Grevillea wickhamii</i> subsp. <i>wickhamii</i> , <i>Buchanania oblongifolia</i> , <i>Grevillea refracta</i> subsp. <i>refracta</i> , <i>Calytrix exstipulata</i>
Next Shrub Layer:	<i>Distichostemon hispidulus</i> var. <i>aridus</i> , <i>Scaevola macrostachya</i> , <i>Acacia multisiliqua</i> , <i>Grevillea agrifolia</i> subsp. <i>agrifolia</i> , <i>Acacia hippuroides</i> , <i>Templetonia hookeri</i> , <i>Gompholobium subulatum</i>
Tallest ground species:	<i>Triodia bynoei</i> , <i>Eriachne ciliata</i>
Climbers:	<i>Ampelocissus acetosa</i> , <i>Galactia tenuiflora</i>
Herbs:	<i>Cleome viscosa</i> , <i>Gonocarpus leptothecus</i> , <i>Trachymene didiscoides</i> , <i>Stackhousia intermedia</i>
Sedges:	<i>Fimbristylis cymosa</i>

## 5 Low Woodland

- 5a Low Woodland of *Corymbia confertiflora*, *Eucalyptus tectifica* over Open Shrubland of *Grevillea agrifolia* subsp. *agrifolia*, *Flueggea virosa* subsp. *melanthesoides* over Very Open Hummock Grassland of *Triodia bynoei* in saddles of range, with Low Open Shrubland of *Calytrix exstipulata*, *Calytrix brownii*, *Buchanania oblongifolia* over Very Open Hummock Grassland of *Triodia bynoei* on peaks

Quadrats Sampled: 33

Area: 3.8 ha or 0.4%

### Location and Landform

Vegetation Association 5a was mapped as a mosaic comprising a mixture of steep rocky hill slopes and peaks, and saddles along the range crest. The unit was restricted to the black ironstone range aligned east west along the southern shores of Isthmus Point. Vegetation was associated with skeletal pockets of soil along the majority of the range, with deeper brown loams present in the swales. Vegetation of the rocky slopes and peaks was characterized by a Low Open Shrubland of *Calytrix exstipulata*, *Calytrix brownii* and *Buchanania oblongifolia* over Very Open Hummock Grassland of *Triodia bynoei*. The swales supported a taller and denser vegetation unit comprising Low Woodland of *Corymbia confertiflora* and *Eucalyptus tectifica* over Open Shrubland of *Grevillea agrifolia* subsp. *agrifolia* and *Flueggea virosa* subsp. *melanthesoides* and Very Open Hummock Grassland of *Triodia bynoei*. Vegetation condition was rated as ‘excellent’ over the majority of the area, with recent exploration activities evident in parts.

### Vegetation Structure and Floristics - Swales

- Tallest tree stratum: *Corymbia confertiflora*, *Eucalyptus tectifica*  
Tallest shrub layer: *Grevillea agrifolia* subsp. *agrifolia*, *Flueggea virosa* subsp. *melanthesoides*  
Tallest ground species: *Triodia bynoei*

### Vegetation Structure and Floristics - Hill Slopes and Peaks

- Tallest shrub layer: *Calytrix exstipulata*, *Calytrix brownii*, *Buchanania oblongifolia*  
Tallest ground species: *Triodia bynoei*

## 6 Low Open Woodland

- 6a Low Open Woodland of *Eucalyptus tectifica*, *Corymbia confertiflora*, *Corymbia cadophora* subsp. *cadophora*, *Corymbia polycarpa* over Shrubland of *Grevillea agrifolia* subsp. *agrifolia*, *Grevillea refracta* subsp. *refracta*, *Buchanania oblongifolia* over Low Open Heath of *Scaevola macrostachya*, *Distichostemon hispidulus* var. *aridus*, *Acacia wickhamii* subsp. *wickhamii*

**Quadrats Sampled:** 2, 6, 10, 16, 18, 86

**Area:** 23.7 ha or 2.5%

### Location and Landform

Vegetation Association 6a occurred at the northern end of Hardstaff Peninsula and on the south-east corner of Isthmus Point in skeletal brown loam soils on mid to upper hill slopes. A feature of the geology was the visual evidence of mineralised iron within the outcropping sandstone. Vegetation was characterised by the occurrence of *Eucalyptus tectifica* and *Corymbia polycarpa* in the canopy. The dense understorey strata, particularly the Low Open Heath layer, were reflective of the adjacent vegetation association (7a). Bare ground was estimated at less than 30%. Vegetation condition was rated as ‘very good’ to ‘excellent’, with disturbance restricted to narrow walk trails and drill pads constructed as part of the current exploration program.

### Vegetation Structure and Floristics

- Tallest tree stratum: *Eucalyptus tectifica*, *Corymbia confertiflora*, *Corymbia cadophora* subsp. *cadophora*, *Corymbia polycarpa*, *Eucalyptus cf. miniata*
- Tallest shrub layer: *Grevillea agrifolia* subsp. *agrifolia*, *Grevillea refracta* subsp. *refracta*, *Buchanania oblongifolia*, *Calytrix exstipulata*, *Acacia tumida*, *Verticordia verticillatus*, *Hakea arborescens*
- Next Shrub Layer: *Scaevola macrostachya*, *Distichostemon hispidulus* var. *aridus*, *Acacia wickhamii* subsp. *wickhamii* *Desmodium brownii*, *Indigostrum parviflorum*, *Tephrosia subpectinata*
- Tallest ground species: *Sorghum plumosum*, *Triodia bynoei*
- Climbers: *Ampelocissus acetosa*, *Vigna lanceolata* var. *filiformis*
- Herbs: *Cleome viscosa*, *Trachymene didiscoides*, *Gonocarpus leptothecus*

- 6b Low Open Woodland of *Corymbia confertiflora*, *Ficus platypoda* over High Open Shrubland of *Calytrix exstipulata*, *Verticordia verticillatus*, *Buchanania obovata*, *Grevillea refracta* subsp. *refracta* over Open Hummock Grassland of *Triodia bynoei*, *Triodia pungens***

**Quadrats Sampled:** 30, 36, 38, 48, 54

**Area:** 56.3 ha or 5.9%

#### **Location and Landform**

Vegetation Association 6b was associated with moderate to steep hill-slopes occurring on outer limits of the Irvine Island Study area. The skeletal soils were variable ranging from grey brown loams and loamy sands, to cream brown clay loams and sandy clays. Vegetation was characterized by the Low Open Woodland of *Corymbia confertiflora* and *Ficus platypoda*, High Open Shrubland of *Calytrix exstipulata*, *Verticordia verticillatus*, *Buchanania obovata* and *Grevillea refracta* subsp. *refracta* and Open Hummock Grassland of *Triodia bynoei* and *Triodia pungens*. Bare ground was estimated at 15%. Vegetation condition was rated as 'excellent'.

#### **Vegetation Structure and Floristics**

Tallest tree stratum:	<i>Corymbia confertiflora</i> , <i>Ficus platypoda</i>
Tallest shrub layer:	<i>Calytrix exstipulata</i> , <i>Verticordia verticillatus</i> , <i>Buchanania obovata</i> , <i>Grevillea refracta</i> subsp. <i>refracta</i>
Next Shrub Layer:	<i>Grevillea agrifolia</i> subsp. <i>agrifolia</i> , <i>Grevillea wickhamii</i> subsp. <i>wickhamii</i> , <i>Acacia wickhamii</i> subsp. <i>wickhamii</i> , <i>Scaevola macrostachya</i> , <i>Distichostemon hispidulus</i> var. <i>aridus</i>
Tallest ground species:	<i>Triodia bynoei</i> , <i>Triodia pungens</i>

**6c Low Open Woodland of *Corymbia confertiflora* over Open Shrubland of *Buchanania oblongifolia*, *Grevillea wickhamii* subsp. *wickhamii* over Low Open Heath of *Scaevola macrostachya*, *Acacia wickhamii* subsp. *wickhamii*, *Distichostemon hispidulus* var. *aridus***

**Quadrats Sampled:** 11, R8

**Area:** 19.8 ha or 2.1%

#### **Location and Landform**

Vegetation Association 6c occurred on stony mid slopes situated west of the current exploration camp on Hardstaff Peninsula. Surface soil was a brown loam and basement rock sandstone, with outcropping boulders and cobbles common throughout. Vegetation was closely affiliated with Vegetation Association 7a, differentiated by the development of a sparse canopy stratum of *Corymbia confertiflora* forming Low Open Woodland. Vegetation condition was rated as 'excellent' with minor disturbance related to the current exploration program.

#### **Vegetation Structure and Floristics**

Tallest tree stratum:	<i>Corymbia confertiflora</i>
Tallest shrub layer:	<i>Buchanania oblongifolia</i> , <i>Grevillea wickhamii</i> subsp. <i>wickhamii</i>
Next Shrub Layer:	<i>Scaevola macrostachya</i> , <i>Acacia wickhamii</i> subsp. <i>wickhamii</i> , <i>Distichostemon hispidulus</i> var. <i>aridus</i> , <i>Triufetta incana</i> , <i>Calytrix exstipulata</i> , <i>Hybanthus aurantiacus</i>
Tallest ground species:	<i>Sorghum plumosum</i> , <i>Triodia bynoei</i>
Climbers:	<i>Ampelocissus acetosa</i>
Herbs:	<i>Cleome viscosa</i> , <i>Gonocarpus leptothecus</i>
Sedges:	<i>Fimbristylis cymosa</i>

- 6d Low Open Woodland of *Corymbia cadophora* subsp. *cadophora*, *Corymbia confertiflora* over Open Shrubland of *Grevillea wickhamii* subsp. *wickhamii*, *Buchanania oblongifolia* over Low Open Shrubland of *Triumfetta incana*, *Calytrix brownii* over Very Open Hummock Grassland of *Triodia bynoei*, *Triodia pungens***

**Quadrats Sampled:** 15, 23, 40, 44, 50

**Area:** 59.3 ha or 6.2%

#### **Location and Landform**

Vegetation Association 6d was associated with narrow ephemeral drainage lines (with exposed sandstone along drainage channels) and sandstone outcrops occurring predominantly through central parts of the Study area. Soils were skeletal brown loams and clay loams. Vegetation was characterised by sparse vegetation strata, as reflected by the high bare ground estimate range of between 40% and 90%. The low shrub taxa *Triumfetta incana* and *Calytrix brownii* were also characteristic of Vegetation Association 6d. Vegetation condition was rated as 'excellent'.

#### **Vegetation Structure and Floristics**

Tallest tree stratum:	<i>Corymbia cadophora</i> subsp. <i>cadophora</i> , <i>Corymbia confertiflora</i> , <i>Eucalyptus tectifica</i> , <i>Acacia oligoneura</i>
Tallest shrub layer:	<i>Grevillea wickhamii</i> subsp. <i>wickhamii</i> , <i>Buchanania oblongifolia</i>
Next Shrub Layer:	<i>Triumfetta incana</i> , <i>Calytrix brownii</i> , <i>Xenostegia tridentata</i> , <i>Tephrosia rosea</i> , <i>Scaevola macrostachya</i> , <i>Grevillea wickhamii</i> subsp. <i>wickhamii</i> , <i>Corchorus pumilio</i> , <i>Crotalaria montana</i> var. <i>angustifolia</i> , <i>Helicteres rhynchocarpa</i>
Tallest ground species:	<i>Triodia bynoei</i> , <i>Triodia pungens</i> , <i>Sorghum plumosum</i> , <i>Chrysopogon latifolius</i> , <i>Eriachne ciliata</i>
Herbs:	<i>Cleome viscosa</i>
Sedges:	<i>Bulbostylis barbata</i>

## 7 Low Open Heath

- 7a Low Open Heath (to Low Closed Heath) of *Scaevola macrostachya*, *Grevillea wickhamii* subsp. *wickhamii*, *Distichostemon hispidulus* var. *aridus*

**Quadrats Sampled:** 1, 3, 7, 9, 17, 20, 26, 27, 37, 46, 47, 53, 67, 69, 84, 85, 93, 94, 95, 96

**Area:** 133.3 ha or 14.0%

### Location and Landform

Vegetation Association 7a was associated with exposed sandstone ridges, hill crests and hill slopes occurring along the coastal fringes of the Study area. Soil was a skeletal grey brown sandy loam, with heavy outcropping of the basement sandstone rock. Vegetation was characterized by the dominant low shrub stratum (shrubs <1 m in height) forming Low Open Heath (to Low Closed Heath). Vegetation condition was rated as 'excellent'.

### Vegetation Structure and Floristics

Tallest shrub layer:	<i>Calytrix exstipulata</i> , <i>Acacia tumida</i> , <i>Grevillea refracta</i> subsp. <i>refracta</i>
Next Shrub Layer:	<i>Scaevola macrostachya</i> , <i>Grevillea wickhamii</i> subsp. <i>wickhamii</i> , <i>Distichostemon hispidulus</i> var. <i>aridus</i> , <i>Acacia wickhamii</i> subsp. <i>wickhamii</i> , <i>Grevillea agrifolia</i> subsp. <i>agrifolia</i> , <i>Buchanania oblongifolia</i> , <i>Acacia hippuroides</i> , <i>Cajanus cinereus</i> , <i>Grevillea pyramidalis</i> subsp. <i>pyramidalis</i> , <i>Terminalia canescens</i> , <i>Hibiscus leptoclados</i> , <i>Solanum echinatum</i> , <i>Corchorus pumilio</i> , <i>Phyllanthus exilis</i> , <i>Hybanthus aurantiacus</i>
Tallest ground species:	<i>Triodia bynoei</i> , <i>Eriachne ciliata</i>
Sedges:	<i>Fimbristylis cardiocarpa</i>
Creepers:	<i>Bonamia pannosa</i>
Herbs:	<i>Trachymene didiscoides</i> , <i>Cleome viscosa</i> , <i>Gonocarpus leptothecus</i> , <i>Stackhousia intermedia</i>

## 8 Scattered Shrubs

- 8a Scattered Shrubs of *Ficus platypoda* over Low Open Shrubland of *Cajanus cinereus*, *Calytrix exstipulata*, *Corchorus fascicularis* over Very Open Hummock Grassland of *Triodia bynoei*, *Triodia pungens***

**Quadrats Sampled:** 100, R9

**Area:** 42.9 ha or 4.5%

### Location and Landform

Vegetation Association 8a was associated with very steep to vertical cliff lines occurring around the outer perimeter of a large proportion of the Irvine Island Study area. Soils were skeletal sandy loams often occurring on cliff ledges or within narrow rock crevices. Vegetation was characterized by Scattered Shrubs of *Ficus platypoda* which often occurred above a Low Open Shrubland of *Cajanus cinereus*, *Calytrix exstipulata* and *Corchorus fascicularis*. When present, the ground cover comprised a Very Open Hummock Grassland of *Triodia bynoei* and/or *Triodia pungens*. Vegetation condition was rated as 'excellent'.

### Vegetation Structure and Floristics

Tallest tree stratum:	<i>Ficus platypoda</i> , <i>Hakea arborescens</i> , <i>Ficus aculeata</i> var. <i>indecora</i> , <i>Brachychiton viscidulus</i>
Tallest shrub layer:	<i>Grevillea refracta</i> subsp. <i>refracta</i> , <i>Terminalia canescens</i> , <i>Verticordia verticillatus</i>
Next Shrub Layer:	<i>Cajanus cinereus</i> , <i>Calytrix exstipulata</i> , <i>Corchorus fascicularis</i> , <i>Scaevola macrostachya</i> , <i>Distichostemon hispidulus</i> var. <i>aridus</i> , <i>Acacia wickhamii</i> subsp. <i>wickhamii</i> , <i>Triumfetta incana</i>
Tallest ground species:	<i>Triodia bynoei</i> , <i>Triodia pungens</i>

## 9 Tussock Grassland

### 9a Tussock Grassland of *Spinifex longifolius*

**Quadrats Sampled:** 34, Rel.a

**Area:** 0.2 ha or <0.1%

#### Location and Landform

Vegetation Association 9a was associated with narrow linear foredunes situated behind small beaches located at the south-west corner of Hardstaff Peninsula (adjacent to the desalination plant), and at the south-west limit of Isthmus. *Spinifex longifolius* formed a Tussock Grassland in white beach sand. Vegetation condition was rated as 'very good'.

#### Vegetation Structure and Floristics

Tallest shrub layer: *Crotalaria medicaginea* var. *neglecta*

Tallest ground species: *Spinifex longifolius*, *Salsola cf. tragus*, *Dactyloctenium radulans*

Creepers: *Ipomoea pes-caprae* ssp. *brasiliensis*

## Vegetation Legend

Beach (Bare).

### Low Closed Forest

- 1a** Low Closed Forest of *Sonneratia alba*.
- 1b** Low Closed Forest of *Rhizophora stylosa* and *Avicennia marina*.
- 1c** Low Closed Forest of *Rhizophora stylosa*.
- 1d** Low Closed Forest of *Pandanus spiralis*.

### Low Open Forest

- 2a** Low Open Forest (to Low Closed Forest) of *Canarium australianum* var. *australianum*, *Sersalisia sericea*, *Mimusops elengi*, *Brachychiton diversifolius* subsp. *diversifolius* over Very Open Tussock Grassland of *Sorghum plumosum*.
- 2b** Low Open Forest of *Eucalyptus* cf. *miniata*, *Eucalyptus tectifica*, *Corymbia cadophora* subsp. *cadophora* over Low Shrubland of *Acacia wickhamii* subsp. *wickhamii*, *Scaevola macrostachya*, *Microstachys chamaelea* over Tussock Grassland of *Chrysopogon latifolius*, *Sorghum plumosum*.

### Woodland

- 3a** Woodland of *Eucalyptus miniata* over Shrubland of *Calytrix exstipulata*, *Acacia wickhamii* subsp. *wickhamii*, *Flueggea virosa* subsp. *melanthesoides* over Closed Hummock Grassland of *Triodia bynoei*.

### Open Woodland

- 4a** Open Woodland of *Eucalyptus* cf. *miniata* over Low Woodland of *Eucalyptus* cf. *miniata*, *Corymbia cadophora* subsp. *cadophora* over Low Closed Heath of *Acacia hippuroides*, *Gonocarpus leptothecus*, *Microstachys chamaelea* with Very Open Tussock Grassland of *Sorghum plumosum*.
- 4b** Open Woodland of *Eucalyptus* cf. *miniata* over Low Woodland of *Eucalyptus* cf. *miniata*, *Corymbia cadophora* subsp. *cadophora* over Open Shrubland of *Grevillea wickhamii* subsp. *wickhamii*, *Buchanania oblongifolia*, *Grevillea refracta* subsp. *refracta* over Low Open Heath of *Distichostemon hispidulus* var. *aridus*, *Scaevola macrostachya*, *Gonocarpus leptothecus* over Open Hummock Grassland of *Triodia bynoei*.

### Low Woodland

- 5a** Low Woodland of *Corymbia confertiflora*, *Eucalyptus tectifica* over Open Shrubland of *Grevillea agrifolia* subsp. *agrifolia*, *Flueggea virosa* subsp. *melanthesoides* over Very Open Hummock Grassland of *Triodia bynoei* in saddles of range, with Low Open Shrubland of *Calytrix exstipulata*, *Calytrix brownii*, *Buchanania oblongifolia* over Very Open Hummock Grassland of *Triodia bynoei* on peaks.

### Low Open Woodland

- 6a** Low Open Woodland of *Eucalyptus tectifica*, *Corymbia confertiflora*, *Corymbia cadophora* subsp. *cadophora*, *Corymbia polycarpa* over Shrubland of *Grevillea agrifolia* subsp. *agrifolia*, *Grevillea refracta* subsp. *refracta*, *Buchanania oblongifolia* over Low Open Heath of *Scaevola macrostachya*, *Distichostemon hispidulus* var. *aridus*, *Acacia wickhamii* subsp. *wickhamii*.
- 6b** Low Open Woodland of *Corymbia confertiflora*, *Ficus platypoda* over High Open Shrubland of *Calytrix exstipulata*, *Verticordia verticillatus*, *Buchanania obovata*, *Grevillea refracta* subsp. *refracta* over Open Hummock Grassland of *Triodia bynoei*, *Triodia pungens*.
- 6c** Low Open Woodland of *Corymbia confertiflora* over Open Shrubland of *Buchanania oblongifolia*, *Grevillea wickhamii* subsp. *wickhamii* over Low Open Heath of *Scaevola macrostachya*, *Acacia wickhamii* subsp. *wickhamii*, *Distichostemon hispidulus* var. *aridus*.
- 6d** Low Open Woodland of *Corymbia cadophora* subsp. *cadophora*, *Corymbia confertiflora* over Open Shrubland of *Grevillea wickhamii* subsp. *wickhamii*, *Buchanania oblongifolia* over Low Open Shrubland of *Triumfetta incana*, *Calytrix brownii* over Very Open Hummock Grassland of *Triodia bynoei*, *Triodia pungens*.

### Low Open Heath

- 7a** Low Open Heath (to Low Closed Heath) of *Scaevola macrostachya*, *Grevillea wickhamii* subsp. *wickhamii*, *Distichostemon hispidulus* var. *aridus*.

### Scattered Shrubs

- 8a** Scattered Shrubs of *Ficus platypoda* over Low Open Shrubland of *Cajanus cinereus*, *Calytrix exstipulata*, *Corchorus fascicularis* over Very Open Hummock Grassland of *Triodia bynoei*, *Triodia pungens*.

### Tussock Grassland

- 9a** Tussock Grassland of *Spinifex longifolius*.

### IRVINE ISLAND VEGETATION MAPPING

## 4.7 Vegetation Condition

The DEC (2009) report a continuing general deterioration in the condition of the Northern Kimberley bioregion's main savanna ecosystems, rainforests and riverine forests, mainly due to fire and grazing. Most of the important wetlands recognised (river systems, riverine floodplains, swamp rainforests, freshwater lakes and swamps) are in good condition, but deteriorating. The primary threatening processes for all these wetlands are changed fire regimes, grazing pressure from feral herbivores and changed hydrology. Although no feral vertebrates have colonised the coastal islands, and they are virtually weed-free, hot dry-season fires are becoming increasingly frequent (DEC 2009).

Vegetation condition for the 100 study sites formally assessed at Irvine Island in April and October 2010 ranged from 'Pristine' to 'Very Good', with only minor disturbances recorded. The disturbances noted included access tracks and localised infrastructure dumps remaining from historical BHP exploration activities, and narrow walk tracks and camp laydown established during the current exploration program by Pluton Resources. While the impact of the recent February 2009 wildfire was recorded as a disturbance, it is noted that the cause was by natural means (lightning strike) and a major contributing factor was the long interval between fires and resultant heavy fuel loads in the ground cover. Future management must ensure that fire on the island does not occur in quick succession, and that fire at the end of the dry season in particular is discouraged.

## 4.8 Conservation Significance of Flora and Vegetation

There are 2.3 million hectares of conservation estate (national parks, nature reserves, conservation parks) in the Kimberley, including 14.6% of the North Kimberley Region (DEC 2009). DEC (2009) lists twelve known special landscape, ecosystems and species for the North Kimberley Region, and three of these parameters have relevance or are represented at Irvine Island (Table 6).

**Table 6** Special landscape, ecosystems and species identified by DEC (2009) for the North Kimberley Region (modified from May and McKenzie 2003).  
NR = Not Relevant

Special landscape, ecosystems and species for the North Kimberley Region (modified from May and McKenzie 2003)		Relevance to the Irvine Island Study area, April 2010
1	A drowned coastline with extensive coastal archipelagos from the Buccaneer Archipelago to Sir Graham Moore Island that form a virtually feral- and weed-free microcosm of the Mitchell Subregion and present an opportunity to protect intact ecosystems. In particular Augustus Island (17 952 ha) and Bigge Island (17 190 ha) are large, near-coastal, uninhabited islands with no known feral animals and a diverse intact terrestrial fauna.	Irvine Island is one of 200 islands that form the Buccaneer Archipelago. The island is significantly smaller (893 ha) than Augustus Island (17,952 ha) and Bigge Island (17,190 ha).

Special landscape, ecosystems and species for the North Kimberley Region (modified from May and McKenzie 2003)		Relevance to the Irvine Island Study area, April 2010
2	Off-shore islands such as Pelican, Troughton, Sterna, Browse, Bedwell (Rowley Shoals), Booby, Lacepede Islands, and Adele for turtle nesting, migrating shorebirds and seabird breeding.	NR
3	Mound springs and swamp rainforest.	NR
4	There is tropical laterite flora. In particular the <i>Livistona eastonii</i> palm community of the Mitchell Plateau, a palm dominated landscape, is unique in Western Australia.	NR
5	The flora and fauna of north-western margin appears to be still intact. Critical weight range mammal fauna persist in this region, such as golden bandicoot, scaly-tailed possum, monjon, nabarlek, goldenbacked tree-rat and Kimberley rock-rat. None of the region's original mammals are regionally extinct yet, or are known to have disappeared from more than half of their former ranges across the region.	NR
6	The Cape Bougainville rainforest on laterite and volcanics has no hooved feral animals and is the largest single patch of rainforest in the Kimberley.	NR
7	Airfield Swamp on the Mitchell Plateau is a large perched paperbark forest wetland.	NR
8	The Prince Regent Lineament encompassing the Prince Regent River.	NR
9	There are many endemic invertebrates, vertebrates and plants. All the rainforest patches studied to date have endemic earthworm species associated with them. Endemic plants include <i>Cycas basaltica</i> and <i>Cycas lane-poolei</i> , <i>Acacia kenneallyi</i> , <i>Acacia smeringa</i> , <i>Gossypium londonderryense</i> , <i>Grevillea cravenii</i> , <i>Grevillea donaldiana</i> , <i>Grevillea maherae</i> , <i>Grevillea microstyla</i> , <i>Hibiscus peralbus</i> , <i>Typhonium peltandroides</i> , <i>Auranticarpa resinosa</i> and <i>Hibbertia ledifolia</i> .	NR
10	Sandstone ecosystems include areas of high species and ecosystem diversity and endemism. Rugged sandstone environments can provide fire protection to obligate seeders which are amongst the most vulnerable savanna plants. Regeneration is by seed only and soil seed stores can be eliminated by successive fires.	Sandstone ecosystems were recorded at Irvine Island, but none are listed as being of conservation significance, i.e. PECs, TECs. Until recently, the island has provided long-term protection from fire.

Special landscape, ecosystems and species for the North Kimberley Region (modified from May and McKenzie 2003)		Relevance to the Irvine Island Study area, April 2010
11	Mangroves, riparian forests and rainforest patches are resource centres for distinct faunas, including wide-ranging vagile species that dependent on the archipelago of patches, e.g. rainbow pittas, fruit pigeons, and flying foxes. They also provide dry season refuges for a variety of savanna animals, and have numerous endemic species. Laterite rainforests are of particular interest.	There were three mangrove associations recorded and mapped around the coastal fringe of Irvine Island.  Small rainforest patches were recorded within Vegetation Association 2a.
12	Significant wetlands include the Mitchell River System, Prince Regent River System, Yampi Peninsula #WA115, Walcott Inlet System including Munja Lagoon and the lower reaches of the Isdell and the Charnley Rivers, and Airfield Swamp and Glauerts Lagoon on Mitchell Plateau.	NR

The overall conservation significance of the Irvine Island Study area can be determined on the basis of criteria listed within Commonwealth and State Acts and Agreements detailed in Section 3.2.3 (see Table 7). Within the Irvine Island Study area flora and vegetation values of conservation significance are restricted to locations supporting the Priority 1 flora *Ipomoea* sp. A Kimberley Flora (L.J. Penn 84) and Priority 4 flora *Haemodorum gracile*, mangroves described and mapped as Vegetation Associations 1a, 1b and 1c, and small rainforest patches occurring with Vegetation Association 2a.

**Table 7 Status of conservation significance for flora and vegetation recorded within the Irvine Island Study area.**

Criteria for Conservation Significance	Status
Species listed as Threatened Flora under the <i>Environmental Protection and Biodiversity Conservation Act 1999</i>	None
Species listed as Declared Rare Flora by the DEC under the <i>Wildlife and Conservation Act 1950</i>	None
Species listed as Priority Flora by DEC - Noting these species are not protected by the <i>Wildlife and Conservation Act 1950</i> , but are considered to be of conservation importance at a State level	<i>Ipomoea</i> sp. A Kimberley Flora (L.J. Penn 84) (P1); <i>Phyllanthus aridus</i> (P3); <i>Haemodorum gracile</i> (P4)
Vegetation associations listed as Threatened Ecological Communities under the <i>Environmental Protection and Biodiversity Conservation Act 1999</i> (Commonwealth level)	None
Vegetation associations listed as Priority Ecological Communities (PEC) as per the DEC Priority list (State level)	None
Species not formally identified, yet considered of conservation importance on a local level because of their patterns of distribution and abundance - this status includes regionally endemic species and species with specific landform requirements that are in decline	None

<b><i>Criteria for Conservation Significance</i></b>	<b>Status</b>
Vegetation associations that are not directly threatened, but in need of increased reservation	Mangroves (Vegetation Associations 1a, 1b, 1c)  Small rainforest patches were recorded within Vegetation Association 2a.

## 5.0 Discussion

The only formal baseline flora and vegetation survey previously completed at Irvine Island was conducted by Mattiske Consulting over eleven days in June and September 2007. The survey concentrated on the Hardstaff Peninsula and Isthmus Point areas. A total of 86 plant taxa from 40 families were recorded including one introduced (weed) species *\*Passiflora foetida*. There was no flora of Federal or State conservation significance recorded. Vegetation was described and mapped as 14 vegetation associations, with none of the associations being of conservation significance.

The three day survey of Hardstaff Peninsula completed by Onshore Environmental in April 2010 recorded 172 plant taxa from 55 families including two Priority flora species determined to be of State conservation significance; *Ipomoea* sp. A Kimberley Flora (L.J. Penn 84) (Priority 1) and *Haemodorum gracile* (Priority 4), and two introduced (weed) species; *\*Melinis repens* and *\*Passiflora foetida* var. *hispida*. Vegetation was described and mapped as twelve vegetation associations. The discrepancy in the number of plant taxa recorded at Irvine Island during the Mattiske (2007) and Onshore Environmental (2010) surveys, 86 plant taxa in 2007 compared to 172 plant taxa in 2010, can be attributed to the different burn regimes. Approximately 30% of the flora recorded in 2010 (14 months post-fire) was annual or ephemeral species. In comparison, only 15% of the flora recorded in 2007 (long unburnt) comprised annual or ephemeral species.

The 14 day dry season survey completed by Onshore Environmental between the 13<sup>th</sup> and 26<sup>th</sup> October 2010 covered Irvine Island, Flora Island, and parts of Bathurst Island and Kathleen Island. A total of 204 plant taxa (including varieties and subspecies) from 62 families and 142 genera were recorded. Species representation was greatest among the Fabaceae, Malvaceae, Poaceae, Myrtaceae, Convolvulaceae, Proteaceae, Cyperaceae, Apocynaceae, Phyllanthaceae and Euphorbiaceae families. No plant taxa gazetted as Declared Rare Flora pursuant to subsection (2) of section 23F of the *Wildlife Conservation Act (1950)*, or listed under the *EPBC Act 1999*, were recorded. Two Priority taxa were recorded; *Phyllanthus aridus* (Priority 3) and *Haemodorum gracile* (Priority 4). *Phyllanthus aridus* occurred as scattered plants at one locality on the central western fringe of Irvine Island. *Haemodorum gracile* was recorded from a number of areas around Irvine Island, as well as from neighbouring Kathleen, Flora and Bathurst Islands. A second Priority 1 flora recorded from a single location at the northern end of Hardstaff Peninsula (on Irvine Island) in April 2010, *Ipomoea* sp. A Kimberley Flora (L.J. Penn 84), could not be relocated in October 2010. A targeted survey for this taxon will be completed during the proposed wet season survey in March 2011. The total flora recorded in October 2010 included two introduced (weed) species; *\*Melinis repens* (Blanketgrass) and *\*Passiflora foetida* var. *hispida* (Wild Passionfruit). Neither taxon is listed as a Declared Weed under the *Agriculture and Related Resources Protection Act, 1976* (ARRP Act). Seventeen vegetation associations were described and mapped from Irvine Island; none of the vegetation associations described are listed as Threatened Ecological Communities (TECs) or Priority Ecological Community (PECs). DEC (2009) identify mangroves, riparian forests and rainforest

patches as ‘special landscapes and ecosystems’. Mangrove and rainforest patches were both recorded on Irvine Island. There were three mangrove associations recorded and mapped around the coastal fringe as Vegetation Associations 1a, 1b and 1c. Species richness for the mangrove associations was low and none of the plant taxa were determined to be of conservation significance. Similar mangrove associations have previously been recorded at neighbouring Cockatoo and Koolan Islands (Ecologia Environment 2004b). Small rainforest patches were recorded on steep sided valleys along a large ephemeral drainage line associated with Vegetation Association 2a at Irvine Island. These ‘patches’ were often difficult to differentiate from surrounding vegetation owing to their small size, and the impact of recent wildfire. None of the associated flora was determined to be of conservation significance. Similar rainforest patches have previously been recorded at nearby Koolan Island (Ecologia Environment 2004b).

Irvine Island is one of 2,633 islands that occur along the Kimberley coast and one of 423 islands with an area greater than 20 ha (DEC 2009). The Kimberley islands may be of importance in providing refuge for flora and fauna under pressure from threatening processes affecting mainland ecosystems, including introduction of weeds and feral animals, and changes in the frequency and seasonality of fire (both arson and wildfire). The April and October 2010 flora and vegetation surveys confirmed the occurrence of two introduced (weed) flora at Irvine Island. It is likely that seed for both weed species was introduced by birds from neighbouring Cockatoo or Koolan Islands where a suite of introduced plant taxa have previously been recorded.

The vegetation of Irvine Island was long unburnt until February 2009 when wildfire resulting from lightning strike removed heavy fuel loads across the majority of the island. While the wildfire has altered the short-term vegetation structure, it has also stimulated a number of opportunistic annual and ephemeral plant taxa that are only seen in the early growing seasons following fire. It will be important that fire at Irvine Island is discouraged in the short to medium term, particularly late in the dry season when fire intensity can be extreme. Vegetation mapping of the entire island will contribute to fire management strategies aimed at protecting vulnerable associations.

A selection of Kimberley islands have been proposed for reservation since the 1970s (Burbidge *et al.* 1991). Much of the conservation planning is based on the vegetation association mapping of Beard (1979). Beard’s mapping was completed at a relatively coarse scale, and based solely on photo interpretation for the Yampi Peninsula unit. Vegetation communities identified as being of high conservation significance such as rainforest patches and mound springs require high resolution mapping and confirmation by ground truthing to confirm distribution owing to their small size. Survey of the Irvine Island Study area in April and October 2010 did not identify any vegetation associations listed to be of State or Federal conservation significance.

## 6.0 Study Team

The Level 2 flora and vegetation survey of the Irvine Island Study area was planned, co-ordinated and executed by the following personnel:

**Level 2 Flora & Vegetation Survey**  
**Onshore Environmental Consultants P/L**

**APPENDIX 1      Vegetation Classifications based on Specht (1970), as modified by Aplin (1979).**

Life form & height of tallest stratum	Projected % foliage cover of tallest stratum	Description
Trees over 30 metres	70-100 30-70 10-30 2-10 <2	High closed forest High open forest High woodland High open woodland Scattered tall trees
Trees 10-30 metres	70-100 30-70 10-30 2-10 <2	Closed forest Open forest Woodland Open woodland Scattered trees
Trees under 10 metres	70-100 30-70 10-30 2-10 <2	Low closed forest Low open forest Low woodland Low open woodland Scattered low trees
Shrubs over 2 metres	70-100 30-70 10-30 2-10 <2	Closed scrub Open scrub High shrubland High open shrubland Scattered tall shrubs
Shrubs 1-2 metres	70-100 30-70 10-30 2-10 <2	Closed heath Open heath Shrubland Open shrubland Scattered shrubs
Shrubs under 1 metre	70-100 30-70 10-30 2-10 <2	Low closed heath Low open heath Low shrubland Low open shrubland Low scattered shrubs
Herbs, sedges, grasses	70-100 30-70 10-30 2-10 <2	Closed herb, sedge, grassland Herb, sedge, grassland Open herb, sedge, grassland Very open herb, sedge, grassland Scattered herbs, sedges, grasses

Grasslands then divided into:

Tussock grasslands (perennial tussock species, e.g. *Eragrostis* spp.)

Annual tussock grasslands (e.g. *Sorghum* spp.)

Hummock grasslands (i.e. *Triodia* spp. that form hummocks)

Curly spinifex grasslands (i.e. *Triodia* spp. that do not form hummocks)

**APPENDIX 2      Vegetation condition scale (as developed by Keighery 1994).**

CONDITION	SCALE	DESCRIPTION
Pristine	1	Pristine or nearly so, no obvious signs of disturbance.
Excellent	2	Vegetation structure intact, disturbance affecting individual species and weeds are non-aggressive species.
Very Good	3	Vegetation structure altered; obvious signs of disturbance.
Good	4	Vegetation structure significantly altered by very obvious signs of multiple disturbances. Retains basic vegetation structure or ability to regenerate it.
Degraded	5	Basic vegetation structure severely impacted by disturbance. Scope for regeneration but not to a state approaching Very Good condition without intensive management.
Completely Degraded	6	The structure of the vegetation is no longer intact and the area is completely or almost completely without native species.

**APPENDIX 3      Conservation categories for flora described under the EPBC Act.**

CATEGORY	DESCRIPTION
Extinct	A species is extinct if there is no reasonable doubt that the last member of the species has died.
Extinct in the Wild	A species is categorised as extinct in the wild if it is only known to survive in cultivations, in captivity, or as a naturalised population well outside its past range; or if it has not been recorded in its known/expected habitat, at appropriate seasons, anywhere in its past range, despite exhaustive surveys over a time frame appropriate to its life cycle and form.
Critically Endangered	The species is facing an extremely high risk of extinction in the wild and in the immediate future.
Endangered	The species is likely to become extinct unless the circumstances and factors threatening its abundance, survival, or evolutionary development cease to operate; or its numbers have been reduced to such a critical level, or its habitats have been so drastically reduced, that it is in immediate danger of extinction.
Vulnerable	Within the next 25 years, the species is likely to become endangered unless the circumstances and factors threatening its abundance, survival or evolutionary development cease to operate.
Conservation Dependent	The species is the focus of a specific conservation program, the cessation of which would result in the species becoming vulnerable, endangered or critically endangered within a period of 5 years.

**APPENDIX 4 Conservation Codes for Western Australian Flora (see Atkins 2006).**

**R: Declared Rare Flora - Extant Taxa**

Taxa which have been adequately searched for, and are deemed to be in the wild either rare, in danger of extinction, or otherwise in need of special protection, and have been gazetted as such.

**1: Priority One - Poorly Known Taxa**

Taxa which are known from one or a few (generally <5) populations which are under threat, either due to small population size, or being on lands under immediate threat, e.g. road verges, urban areas, farm land, active mineral leases, etc., or the plants are under threat, e.g. from disease, grazing by feral animals etc. May include taxa with threatened populations on protected lands. Such taxa are under consideration for declaration as 'rare flora', but are in urgent need for further survey.

**2: Priority Two - Poorly Known Taxa**

Taxa which are known from one or a few (generally <5) populations, at least some of which are not believed to be under immediate threat (i.e. not currently endangered). Such taxa are under consideration for declaration as 'rare flora', but are in urgent need for further survey.

**3: Priority Three - Poorly Known Taxa**

Taxa which are known from several populations, at least some of which are not believed to be under immediate threat (i.e. not currently endangered). Such taxa are under consideration for declaration as 'rare flora', but are in urgent need for further survey.

**4: Priority Four - Rare Taxa**

Taxa which are considered to have been adequately surveyed and which, whilst being rare (in Australia), are not currently threatened by any identifiable factors. These taxa require monitoring every 5-10 years.

**APPENDIX 5 Total flora recorded from the Irvine Island Study area by Onshore Environmental Consultants, 8th-10th April 2010 and 13<sup>th</sup> to 26<sup>th</sup> October 2010.**

FAMILY	SPECIES	Apr '10	Oct '10
ACANTHACEAE	<i>Avicennia marina</i>	+	+
	<i>Dicliptera armata</i>	+	+
	<i>Rostellularia adscendens var. clementii</i>	+	+
AIZOACEAE	<i>Sesuvium portulacastrum</i>		+
AMARANTHACEAE	<i>Gomphrena cf. leptoclada</i>		+
	<i>Ptilotus capitatus</i>	+	+
	<i>Ptilotus polystachyus var. longistachyus</i>	+	+
ANACARDIACEAE	<i>Buchanania oblongifolia</i>	+	+
APIACEAE	<i>Trachymene didiscoides</i>	+	+
APOCYNACEAE	<i>Cynanchum pedunculatum</i>	+	+
	<i>Cynanchum puberulum</i>		+
	<i>Cynanchum sp. indet.</i>		+
	<i>Marsdenia pleiadenia</i>	+	
	<i>Marsdenia viridiflora ssp. tropica</i>	+	+
	<i>Sarcostemma viminale ssp. australe</i>		+
	<i>Wrightia saligna</i>	+	+
ASPARAGACEAE	<i>Asparagus racemosus</i>	+	+
ASTERACEAE	<i>Pentalepis ecliptoides</i>	+	+
	<i>Peripleura spechtii var. kimberleyensis</i>		+
	<i>Pterocaulon sphacelatum</i>		+
	<i>Vittadinia sp. A Kimberley Flora (R.J. Cranfield 6527)</i>		+
BIXACEAE	<i>Cochlospermum fraseri</i>	+	+
BORAGINACEAE	<i>Heliotropium glabellum</i>	+	+
	<i>Heliotropium sp. indet.</i>		+
	<i>Trichodesma zeylanicum var. latisepalum</i>		+
BURSERIACEAE	<i>Canarium australianum var. australianum</i>	+	+
BYBLIDACEAE	<i>Byblis filifolia</i>	+	
CAPPARACEAE	<i>Capparis spinosa var. nummularia</i>		+

FAMILY	SPECIES	Apr '10	Oct '10
CARYOPHYLLACEAE	<i>Polycarpaea involucrata</i>	+	+
CELASTRACEAE	<i>Stackhousia intermedia</i>	+	
CHENOPodiaceae	<i>Salsola tragus ssp. tragus</i>	+	+
CLEOMACEAE	<i>Cleome viscosa</i>	+	+
COMBRETACEAE	<i>Terminalia canescens</i>	+	+
	<i>Terminalia cf. latipes</i>	+	
	<i>Terminalia ferdinandiana</i>	+	+
	<i>Terminalia hadleyana</i>		+
	<i>Terminalia sp. indet.</i>		+
COMMELINACEAE	<i>Cartonema spicatum var. humile</i>	+	
	<i>Commelina ensifolia</i>	+	
	<i>Murdannia graminea</i>	+	
CONVOLVULACEAE	<i>Bonamia pannosa</i>	+	+
	<i>Evolvulus alsinoides var. decumbens</i>	+	+
	<i>Ipomoea eriocarpa</i>	+	+
	<i>Ipomoea macrantha</i>		+
	<i>Ipomoea pes-caprae ssp. brasiliensis</i>	+	+
	<i>Ipomoea sp. A Kimberley Flora (L.J. Penn 84)</i>	+	
	<i>Ipomoea sp. indet.</i>		+
	<i>Jacquemontia paniculata</i>	+	+
	<i>Operculina brownii</i>		+
	<i>Xenostegia tridentata</i>	+	+
CUCURBITACEAE	<i>Cucumis sp. Gunlom (J.L. McKean 864 b)</i>	+	
CYPERACEAE	<i>Bulbostylis aff. barbata</i>	+	
	<i>Bulbostylis barbata</i>	+	+
	<i>Cyperus microcephalus ssp. microcephalus</i>	+	+
	<i>Fimbristylis cardiocarpa</i>	+	
	<i>Fimbristylis cymosa</i>	+	+
	<i>Fimbristylis ferruginea</i>		+
	<i>Fimbristylis leucocolea</i>	+	+
	<i>Fimbristylis schultzii</i>	+	+
	<i>Fimbristylis cf. trigastrocarya</i>		+
	<i>Scleria brownii</i>	+	+
DILLENIACEAE	<i>Hibbertia sp. A Kimberley Flora (T.E.H. Aplin et al. 898)</i>		+

FAMILY	SPECIES	Apr '10	Oct '10
EBENACEAE	<i>Diospyros maritima</i>		+
ERYTHROXYLACEAE	<i>Erythroxylum ellipticum</i>	+	+
EUPHORBIACEAE	<i>Euphorbia bifida</i>	+	
	<i>Euphorbia distans</i>	+	+
	<i>Euphorbia kimberleyensis</i>	+	+
	<i>Euphorbia sp. B Kimberley Flora (B.J. Carter 629)</i>	+	+
	<i>Excoecaria ovalis</i>		+
	<i>Microstachys chamaelea</i>	+	+
FABACEAE	<i>Abrus precatorius ssp. precatorius</i>	+	+
	<i>Acacia hippochooides</i>	+	+
	<i>Acacia multisiliqua</i>	+	+
	<i>Acacia neurocarpa</i>	+	+
	<i>Acacia oligoneura</i>	+	+
	<i>Acacia plectocarpa ssp. plectocarpa</i>		+
	<i>Acacia tumida var. tumida</i>	+	+
	<i>Acacia wickhamii ssp. wickhamii</i>	+	+
	<i>Alysicarpus muelleri</i>	+	
	<i>Cajanus cinereus</i>	+	+
	<i>Cajanus scarabaeoides var. pedunculatus</i>		+
	<i>Canavalia rosea</i>		+
	<i>Chamaecrista mimosoides</i>	+	+
	<i>Christia australasica</i>	+	+
	<i>Crotalaria alata</i>	+	+
	<i>Crotalaria medicaginea var. neglecta</i>	+	+
	<i>Crotalaria montana var. angustifolia</i>	+	+
	<i>Cullen virens</i>		+
	<i>Desmodium brownii</i>	+	
	<i>Desmodium filiforme</i>	+	
	<i>Fabaceae sp. 'tri leaf'</i>		+
	<i>Flemingia parviflora</i>		+
	<i>Galactia tenuiflora</i>	+	+
	<i>Glycine tomentella</i>		+
	<i>Gompholobium subulatum</i>		+
	<i>Indigastrum parviflorum</i>	+	
	<i>Indigofera colutea</i>	+	+
	<i>Indigofera haplophylla</i>	+	+
	<i>Indigofera trita</i>	+	+
	<i>Senna goniodes</i>	+	+
	<i>Templetonia hookeri</i>	+	+
	<i>Tephrosia laxa var. angustata</i>		+

FAMILY	SPECIES	Apr '10	Oct '10
	<i>Tephrosia leptoclada</i>	+	+
	<i>Tephrosia macrocarpa</i>		+
	<i>Tephrosia rosea</i> var. <i>clementii</i>		+
	<i>Tephrosia rosea</i> var. <i>rosea</i>	+	+
	<i>Tephrosia simplicifolia</i>		+
	<i>Tephrosia</i> sp. E Kimberley Flora (C.A. Gardner 9937)		+
	<i>Tephrosia subpectinata</i>	+	+
	<i>Uraria lagopodioides</i>		+
	<i>Vigna lanceolata</i> var. <i>filiformis</i>	+	+
	<i>Vigna radiata</i> cf. var. <i>sublobata</i>		+
FLAGELLARIACEAE	<i>Flagellaria indica</i>	+	+
GOODENIACEAE	<i>Goodenia sepalosa</i> var. <i>sepalosa</i>	+	+
	<i>Scaevola macrostachya</i>	+	+
HAEMODORACEAE	<i>Haemodorum gracile</i>	+	+
HALORAGACEAE	<i>Gonocarpus leptothecus</i>	+	+
LAMIACEAE	<i>Callicarpa candicans</i>		+
	<i>Clerodendrum floribundum</i> var. <i>coriaceum</i>	+	+
	<i>Clerodendrum floribundum</i> var. <i>floribundum</i>	+	
LAURACEAE	<i>Cassytha capillaris</i>	+	+
	<i>Cassytha filiformis</i>		+
LECYTHIDACEAE	<i>Planchonia careya</i>		+
LOGANIACEAE	<i>Mitrasacme connata</i>	+	
	<i>Mitrasacme nudicaulis</i> var. <i>nudicaulis</i>	+	
LORANTHACEAE	<i>Amyema bifurcata</i>	+	+
	<i>Amyema sanguinea</i> var. <i>sanguinea</i>	+	
	<i>Decaisnina angustata</i>		+
	<i>Decaisnina signata</i> ssp. <i>cardiophylla</i>		+
LYTHRACEAE	<i>Sonneratia alba</i>	+	+
MALVACEAE	<i>Abutilon indicum</i> var. <i>australiense</i>		+
	<i>Brachychiton diversifolius</i> ssp. <i>diversifolius</i>	+	+
	<i>Brachychiton viridiflorus</i>	+	+
	<i>Brachychiton viscidulus</i>	+	+
	<i>Campstostemon schultzii</i>		+

FAMILY	SPECIES	Apr '10	Oct '10
	<i>Corchorus fascicularis</i>	+	+
	<i>Corchorus pumilio</i>	+	+
	<i>Grewia breviflora</i>	+	+
	<i>Grewia retusifolia</i>	+	+
	<i>Helicteres rhynchocarpa</i>	+	
	<i>Hibiscus ferox var. mollis</i>	+	+
	<i>Hibiscus leptocladus</i>	+	+
	Malvaceae sp. indet. 1	+	+
	Malvaceae sp. indet. 2		+
	<i>Melhania oblongifolia</i>	+	+
	<i>Melochia umbellata</i>		+
	<i>Thespesia populneoides</i>		+
	<i>Triumfetta albida</i>		+
	<i>Triumfetta carteri</i>		+
	<i>Triumfetta incana</i>	+	
	<i>Triumfetta plumigera</i>	+	+
	<i>Triumfetta ryeae ssp. brevipetala</i>	+	
	<i>Triumfetta triandra</i>	+	+
	<i>Walteria indica</i>	+	+
MELIACEAE	<i>Owenia vernicosa</i>		+
MENISPERMACEAE	<i>Tinospora smilacina</i>	+	+
MORACEAE	<i>Ficus aculeata var. indecora</i>	+	+
	<i>Ficus platypoda</i>	+	+
	<i>Ficus virens</i>		+
MYRTACEAE	<i>Calytrix brownii</i>	+	+
	<i>Calytrix exstipulata</i>	+	+
	<i>Corymbia cadophora ssp. cadophora</i>	+	+
	<i>Corymbia confertiflora</i>	+	+
	<i>Corymbia polycarpa</i>	+	+
	<i>Eucalyptus miniata</i>	+	+
	<i>Eucalyptus obconica</i>		+
	<i>Eucalyptus tectifica</i>	+	+
	<i>Osbornia octodonta</i>	+	
	<i>Verticordia verticillata</i>	+	+
NYCTAGINACEAE	<i>Boerhavia dominii</i>		+
OLEACEAE	<i>Jasminum didymum ssp. didymum</i>	+	+
ORCHIDACEAE	<i>Dendrobium affine</i>		+

FAMILY	SPECIES	Apr '10	Oct '10
OROBANCHACEAE	<i>Buchnera asperata</i>	+	
	<i>Buchnera linearis</i>	+	
	<i>Buchnera urticifolia</i>	+	+
PANDANACEAE	<i>Pandanus spiralis</i>	+	+
PASSIFLORACEAE	<i>Adenia heterophylla</i> ssp. <i>australis</i>	+	+
	* <i>Passiflora foetida</i> var. <i>hispida</i>	+	+
PHYLLANTHACEAE	<i>Breynia cernua</i>		+
	<i>Flueggea virosa</i> ssp. <i>melanthesoides</i>	+	+
	<i>Leptopus decaisnei</i> var. <i>decaisnei</i>	+	+
	<i>Phyllanthus aridus</i>		+
	<i>Phyllanthus exilis</i>	+	+
	<i>Phyllanthus maderaspatensis</i>	+	+
	<i>Phyllanthus reticulatus</i>	+	
	<i>Sauvagesia trachyspermus</i>	+	+
PLANTAGINACEAE	<i>Stemodia lythrifolia</i>		+
PLUMBAGINACEAE	<i>Aegialitis annulata</i>		+
POACEAE	<i>Alloteropsis semialata</i>	+	+
	<i>Aristida cf. sciurodes</i>		+
	<i>Aristida holathera</i> var. <i>holathera</i>		+
	<i>Cenchrus elymoides</i> var. <i>elymoides</i>	+	+
	<i>Chrysopogon latifolius</i>	+	+
	<i>Cymbopogon cf. ambiguus</i>		+
	<i>Cymbopogon procerus</i>	+	+
	<i>Dactyloctenium radulans</i>	+	
	<i>Digitaria brownii</i>	+	+
	<i>Eragrostis cumingii</i>	+	
	<i>Eriachne avenacea</i>		+
	<i>Eriachne ciliata</i>	+	+
	<i>Eriachne obtusa</i>	+	+
	<i>Eulalia aurea</i>		+
	<i>Heteropogon contortus</i>		+
	* <i>Melinis repens</i>	+	+
	<i>Mnesithea formosa</i>	+	
	<i>Panicum mindanense</i>	+	+
	<i>Panicum seminudum</i>	+	+
	<i>Schizachyrium pseudeulalia</i>	+	
	<i>Sehima nervosum</i>	+	
	<i>Sorghum plumosum</i>	+	+
	<i>Spinifex longifolius</i>	+	+

FAMILY	SPECIES	Apr '10	Oct '10
	<i>Triodia cf. aeria</i>		+
	<i>Triodia bynoei</i>	+	+
	<i>Triodia pungens</i>		+
	<i>Triodia sp 'stinky'</i>		+
POLYGALACEAE	<i>Polygala linearifolia</i>	+	
	<i>Polygala sp. Kimberley (R.A. Kerrigan 1111)</i>	+	
PRIMULACEAE	<i>Aegiceras corniculatum</i>	+	+
PROTEACEAE	<i>Grevillea agrifolia ssp. agrifolia</i>	+	+
	<i>Grevillea heliosperma</i>		+
	<i>Grevillea pyramidalis ssp. pyramidalis</i>	+	+
	<i>Grevillea refracta ssp. refracta</i>	+	+
	<i>Grevillea wickhamii ssp. wickhamii</i>	+	+
	<i>Hakea arborescens</i>	+	+
	<i>Persoonia falcata</i>	+	+
	<i>Stenocarpus acacioides</i>		+
RHIZOPHORACEAE	<i>Ceriops australis</i>		+
	<i>Rhizophora stylosa</i>	+	+
RUBIACEAE	<i>Morinda citrifolia</i>		+
	<i>Pavetta kimberleyana</i>		+
	<i>Spermacoce cf. dolichosperma</i>	+	
SANTALACEAE	<i>Exocarpos latifolius</i>	+	+
	<i>Santalum lanceolatum</i>	+	+
SAPINDACEAE	<i>Distichostemon hispidulus var. aridus</i>	+	+
SAPOTACEAE	<i>Mimusops elengi</i>	+	+
	<i>Sersalisia sericea</i>	+	+
SOLANACEAE	<i>Solanum echinatum</i>	+	+
STYLIDACEAE	<i>Stylium semipartitum</i>	+	+
VIOLACEAE	<i>Hybanthus aurantiacus</i>	+	+
VITACEAE	<i>Ampelocissus acetosa</i>	+	+
ZYGOPHYLLACEAE	<i>Tribulopis sp. Koolan Island (K.F. Kenneally 8278)</i>	+
